APPROVAL BY DMEA EXECUTIVE OFFICER OR ALTERNATE:

Signature S/ Thomas E Howard Title Mining Engr Date 3/9/53

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(*a*) *Form MF–104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(*b*) *Form MF–104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(*c*) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF–104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF–104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF–200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF–200; and delete word "Independent" if the contract reported is on Form MF–200 (A). Also, report work paid for on a unit basis under contract Form MF–200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF–104 when submitted for reimbursable expenses incurred under contract Form MF–200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF–200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF–104 is required to be documented. The four copies of Form MF–104 are not to be thus supported.

Form MF–104 submitted for reimbursement under fixed price contracts on Form MF–200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF–104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

REMARKS:

→ NOTE.—Title 18, U. S. Code (Crimes), section 1001, makes it a criminal offense to make a willfully false statement or representation to any department or agency of the United States as to any matter within its jurisdiction.

(Instructions on reverse)

(For Government use only)

INSTRUCTIONS

Preparation of Form MF–104A—Operator's Unit Cost and Progress Report.—Applicable places on Form 104A should be filled in by the Operator. The purpose of this form is twofold as follows: (1) to furnish the supervising engineers and other administrators with statistical information necessary to better determine the progress of the project; and (2) to furnish more permanent information on mining costs for future use. The more important phases of operation on which permanent information is desired have been outlined in the form. There are blank lines, however, for those unusual phases which may need to be reported for a particular project. It will be necessary for the Operator to distribute his costs among the applicable phases reported with the exception of three items the costs of which are not to be distributed by the Operator. These three items are: "Operating Equipment Purchased", "Initial Rehabilitation and Repairs", and "New Buildings, Improvements, etc." The reason for not distributing these items on a monthly basis is doubtless clear to the Operator, since such distribution might well overstate the cost for any one month or period short of the entire contract period.

Form MF–104A has been designed to tie in with Form MF–104 for both monthly and cumulative costs. The "Total Costs" on Form MF–104A for each month should equal the monthly "Total Costs" as reported on Form MF–104. This is also true of the "Total Costs To Date".

In preparing Form MF–104A, it will be necessary frequently to distribute certain costs over a number of items. For instance, supervisory and engineering costs may have to be distributed over several phases, such as, drifting, crosscutting, raising, etc., provided that these items were reported active for the month. Such distributions should be made on the basis of time spent on the various phases, on man days of labor charged to such phases, or on some other equitable basis. "Operating Equipment", "Initial Rehabilitation and Repairs", and "New Buildings Improvements, etc.", will be distributed to the several phases of the project by the Washington Office of DMEA at the close of the project if determined necessary. The last two columns headed "Authorized by Contract" will be filled in by the Operator if such information is found in the contract. This information is usually a part of Exhibit "A" of the contract. A space for remarks has been provided for the use of the Operator to call attention to any unusual circumstances causing excessive or disproportionate unit costs.

WESTERN MONTANA EXPLORATION & DEVELOPMENT CO., INC.

KEY-DURAND LEAD-ZINC Project No. DMA-946X -I-DMA-E30

NARRATIVE Month December, 1952

During the month of December, No. 1 Raise was driven 24.5 feet making a total vertical distance for this raise of 110 feet up from the south drift level.

A short round was drilled into the west wall of the raise at the top to better show the ore at this point. This is shown on the progress map accompanying the report.

The raise encountered U.S. Bureau of Mines diamond drill hole No. 8A at a point 102 feet above the south drift level. A heavy flow of water came out of the drill hole and made it extremely difficult to work in the raise, and slowed progress considerably.

In order to prove which ore shown in the drill hole was cut in the raise, 4 long holes were drilled as shown on the progress map. These holes indicate that it was the second ore shown in the drill hole that the raise encountered.

Until further work is done in the ore at the top of the raise, no definite conclusion is possible relative to the strike and dip of the ore encountered. The ore shows best on the west side of the raise, but the short round drilled into the wall at this point showed another bedding plane fault.

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(a) *Form MF-104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(b) *Form MF-104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(c) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF-104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF-104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF-200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF-200; and delete word "Independent" if the contract reported is on Form MF-200 (A). Also, report work paid for on a unit basis under contract Form MF-200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF-104 when submitted for reimbursable expenses incurred under contract Form MF-200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF-200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF-104 is required to be documented. The four copies of Form MF-104 are not to be thus supported.

Form MF-104 submitted for reimbursement under fixed price contracts on Form MF-200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF-104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

REMARKS:

→ NOTE.—Title 18, U. S. Code (Crimes), section 1001, makes it a criminal offense to make a willfully false statement or representation to any department or agency of the United States as to any matter within its jurisdiction.

(Instructions on reverse)

(For Government use only)

INSTRUCTIONS

Preparation of Form MF-104A—Operator's Unit Cost and Progress Report.—Applicable places on Form 104A should be filled in by the Operator. The purpose of this form is twofold as follows: (1) to furnish the supervising engineers and other administrators with statistical information necessary to better determine the progress of the project; and (2) to furnish more permanent information on mining costs for future use. The more important phases of operation on which permanent information is desired have been outlined in the form. There are blank lines, however, for those unusual phases which may need to be reported for a particular project. It will be necessary for the Operator to distribute his costs among the applicable phases reported with the exception of three items the costs of which are not to be distributed by the Operator. These three items are: "Operating Equipment Purchased", "Initial Rehabilitation and Repairs", and "New Buildings, Improvements, etc." The reason for not distributing these items on a monthly basis is doubtless clear to the Operator, since such distribution might well overstate the cost for any one month or period short of the entire contract period.

Form MF-104A has been designed to tie in with Form MF-104 for both monthly and cumulative costs. The "Total Costs" on Form MF-104A for each month should equal the monthly "Total Costs" as reported on Form MF-104. This is also true of the "Total Costs To Date".

In preparing Form MF-104A, it will be necessary frequently to distribute certain costs over a number of items. For instance, supervisory and engineering costs may have to be distributed over several phases, such as, drifting, crosscutting, raising, etc., provided that these items were reported active for the month. Such distributions should be made on the basis of time spent on the various phases, on man days of labor charged to such phases, or on some other equitable basis. "Operating Equipment", "Initial Rehabilitation and Repairs", and "New Buildings Improvements, etc.", will be distributed to the several phases of the project by the Washington Office of DMEA at the close of the project if determined necessary. The last two columns headed "Authorized by Contract" will be filled in by the Operator if such information is found in the contract. This information is usually a part of Exhibit "A" of the contract. A space for remarks has been provided for the use of the Operator to call attention to any unusual circumstances causing excessive or disproportionate unit costs.

NARRATIVE Month November, 1952

During the month of November, No. 1 Raise was driven 49 feet making a total vertical distance for this raise of 84.5 feet up from the South drift level.

The raise is now showing considerable mineralization with some good ore in streaks and bunches, and it is expected that the next round or two will encounter the ore shown in U.S.B.M. Drill Hole No. 8A.

The formation passed through has been very disappointing in so far as furnishing pertinent data regarding just what has happened to the ore between the drill hole 8A and the Tessa No. 3 Level. Until the ore shown in the drill hole is encountered and its strike and dip determined no prediction of its continuity downward can be made.

A small air hoist was rented from the Miller Machinery Co. of Missoula and installed at the bottom of the raise to hoist timber, drill steel and tools, etc. The air and water lines were extended into and up the raise for drilling, also the vent tubing for ventilation.

A small cave occurred in the fault zone along the south drift which had to be cleaned up by hand mucking.

These small items show on the labor distribution sheet for the month under review.

Francis A. Hancock
Mining Engineer in Charge

CERTIFICATION BY GOVERNMENT REPRESENTATIVE:

I certify that to the best of my knowledge and belief the contractor submitting this voucher is operating a Defense Minerals Exploration Administration project under Contract No. Fdm-E 30 in accordance with the terms of the contract.

Signature John S. McNabb Jr. Title Mining Engineer Date 11-10-52

APPROVAL BY DMEA EXECUTIVE OFFICER OR ALTERNATE:

Signature Thomas E Howard Title Min Engr Date 12-1-52

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(a) *Form MF-104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(b) *Form MF-104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(c) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF-104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF-104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF-200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF-200; and delete word "Independent" if the contract reported is on Form MF-200 (A). Also, report work paid for on a unit basis under contract Form MF-200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF-104 when submitted for reimbursable expenses incurred under contract Form MF-200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF-200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF-104 is required to be documented. The four copies of Form MF-104 are not to be thus supported.

Form MF-104 submitted for reimbursement under fixed price contracts on Form MF-200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF-104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

REMARKS:

NOTE.—Title 18, U. S. Code (Crimes), section 1001, makes it a criminal offense to make a willfully false statement or representation to any department or agency of the United States as to any matter within its jurisdiction.

(Instructions on reverse)

(For Government use only)

INSTRUCTIONS

Preparation of Form MF-104A—Operator's Unit Cost and Progress Report.—Applicable places on Form 104A should be filled in by the Operator. The purpose of this form is twofold as follows: (1) to furnish the supervising engineers and other administrators with statistical information necessary to better determine the progress of the project; and (2) to furnish more permanent information on mining costs for future use. The more important phases of operation on which permanent information is desired have been outlined in the form. There are blank lines, however, for those unusual phases which may need to be reported for a particular project. It will be necessary for the Operator to distribute his costs among the applicable phases reported with the exception of three items the costs of which are not to be distributed by the Operator. These three items are: "Operating Equipment Purchased", "Initial Rehabilitation and Repairs", and "New Buildings, Improvements, etc." The reason for not distributing these items on a monthly basis is doubtless clear to the Operator, since such distribution might well overstate the cost for any one month or period short of the entire contract period.

Form MF-104A has been designed to tie in with Form MF-104 for both monthly and cumulative costs. The "Total Costs" on Form MF-104A for each month should equal the monthly "Total Costs" as reported on Form MF-104. This is also true of the "Total Costs To Date".

In preparing Form MF-104A, it will be necessary frequently to distribute certain costs over a number of items. For instance, supervisory and engineering costs may have to be distributed over several phases, such as, drifting, crosscutting, raising, etc., provided that these items were reported active for the month. Such distributions should be made on the basis of time spent on the various phases, on man days of labor charged to such phases, or on some other equitable basis. "Operating Equipment", "Initial Rehabilitation and Repairs", and "New Buildings Improvements, etc.", will be distributed to the several phases of the project by the Washington Office of DMEA at the close of the project if determined necessary. The last two columns headed "Authorized by Contract" will be filled in by the Operator if such information is found in the contract. This information is usually a part of Exhibit "A" of the contract. A space for remarks has been provided for the use of the Operator to call attention to any unusual circumstances causing excessive or disproportionate unit costs.

KEY-DURAND LEAD-ZINC Project No. DMA-946X-I-DMA-E30

NARRATIVE, Month, October, 1952

The work underground during the month of October was confined to starting a vertical raise from the face of the south drift on the Lower Wasa No. 3 Level, as shown on the progress maps accompanying this report.

This raise is being driven to encounter the ore shown in U.S. Bureau of Mines diamond drill hole No. 8A and expose the structural geology between the south drift level and the drill hole.

The raise was driven a total distance of 35.5 feet. The poor progress made was caused by an injury to one of the miners on October, 9, and our being unable to get another crew of miners until October, 22.

The injured man has now recovered and was able to return to work on November 3, and it is expected the raise will reach the ore shown in the drill hole during the month of November.

No other work was undertaken or accomplished, other than preparations of the camp for winter.

(Signed)

Francis A. Hancock
Mining Engineer in Charge

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(a) *Form MF-104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(b) *Form MF-104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(c) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF-104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF-104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF-200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF-200; and delete word "Independent" if the contract reported is on Form MF-200 (A). Also, report work paid for on a unit basis under contract Form MF-200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF-104 when submitted for reimbursable expenses incurred under contract Form MF-200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF-200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF-104 is required to be documented. The four copies of Form MF-104 are not to be thus supported.

Form MF-104 submitted for reimbursement under fixed price contracts on Form MF-200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF-104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

(For Government use only)

INSTRUCTIONS

Preparation of Form MF–104A—Operator's Unit Cost and Progress Report.—Applicable places on Form 104A should be filled in by the Operator. The purpose of this form is twofold as follows: (1) to furnish the supervising engineers and other administrators with statistical information necessary to better determine the progress of the project; and (2) to furnish more permanent information on mining costs for future use. The more important phases of operation on which permanent information is desired have been outlined in the form. There are blank lines, however, for those unusual phases which may need to be reported for a particular project. It will be necessary for the Operator to distribute his costs among the applicable phases reported with the exception of three items the costs of which are not to be distributed by the Operator. These three items are: "Operating Equipment Purchased", "Initial Rehabilitation and Repairs", and "New Buildings, Improvements, etc." The reason for not distributing these items on a monthly basis is doubtless clear to the Operator, since such distribution might well overstate the cost for any one month or period short of the entire contract period.

Form MF–104A has been designed to tie in with Form MF–104 for both monthly and cumulative costs. The "Total Costs" on Form MF–104A for each month should equal the monthly "Total Costs" as reported on Form MF–104. This is also true of the "Total Costs To Date".

In preparing Form MF–104A, it will be necessary frequently to distribute certain costs over a number of items. For instance, supervisory and engineering costs may have to be distributed over several phases, such as, drifting, crosscutting, raising, etc., provided that these items were reported active for the month. Such distributions should be made on the basis of time spent on the various phases, on man days of labor charged to such phases, or on some other equitable basis. "Operating Equipment", "Initial Rehabilitation and Repairs", and "New Buildings Improvements, etc.", will be distributed to the several phases of the project by the Washington Office of DMEA at the close of the project if determined necessary. The last two columns headed "Authorized by Contract" will be filled in by the Operator if such information is found in the contract. This information is usually a part of Exhibit "A" of the contract. A space for remarks has been provided for the use of the Operator to call attention to any unusual circumstances causing excessive or disproportionate unit costs.

WESTERN MONTANA EXPLORATION & DEVELOPMENT COMPANY, INC.

KEY-DURAND LEAD-ZINC PROJECT NO. DMA-946X, I-DMA-E30

Narrative for Month of September 1952

The work in the mine accomplished during the month of September consisted of driving the South Drift 41 feet, and 13 feet of crosscutting to the west from a point near the face of the drift, as shown on the accompanying progress map.

The face of the South Drift has now reached a point vertically under United States Bureau of Mines Diamond Drill Hole No. 8A as determined by transit survey and as the ore shown in the drill hole has not been found on the level, an upraise is advocated to explore the formation between the level and drill hole and to observe the ore shown in the drill hole.

The 13 feet of crosscut west was for the purpose of cutting through the fault that the South Drift had followed for a distance of 138 feet to expose the formation behind the fault at this point.

During the month under review, Geologists from the New Jersey Zinc Co., American Smelting & Refining Co., and the Consolidated Copper Co. visited the property and made an examination of the surface and underground workings. They were all favorably impressed with its possibilities for ore bodies and unanimous in their opinion that the formation between the level of the South Drift and drill hole above it and the ore in the drill hole as shown in the drill logs should be explored by a raise as advocated. However, geologist from American Smelting and Refining Company did suggest either a long drill hole or diamond core drill hole up 55 degree, bearing N. 45 degrees E. from present face of South Drift as being cheaper than raising to indications in U. S. Bureau of Mines Diamond Drill Hole 8A, such indications being 88'-94' vertically above the present sill and in same plane.

It would indeed be an odd geological situation for the two indications in U. S. Bureau of Mines Diamond Drill Hole 8A directly above present face to represent only "Pods of Ore" in the presence of such strong surface showings 200 feet above the indications (U.S.B.M. Trench No. 14), the showings in U. S. Bureau of Mines Diamond Drill Hole No. 10, 1175 feet to the south of Hole 8A, and the showings north of Diamond Drill Hole 8A, particularly in old Wasa stopes and especially the stope in and above No. 2 Wasa level.

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(a) *Form MF-104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(b) *Form MF-104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(c) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF-104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF-104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF-200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF-200; and delete word "Independent" if the contract reported is on Form MF-200 (A). Also, report work paid for on a unit basis under contract Form MF-200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF-104 when submitted for reimbursable expenses incurred under contract Form MF-200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF-200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF-104 is required to be documented. The four copies of Form MF-104 are not to be thus supported.

Form MF-104 submitted for reimbursement under fixed price contracts on Form MF-200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF-104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

(For Government use only)

INSTRUCTIONS

Preparation of Form MF–104A—Operator's Unit Cost and Progress Report.—Applicable places on Form 104A should be filled in by the Operator. The purpose of this form is twofold as follows: (1) to furnish the supervising engineers and other administrators with statistical information necessary to better determine the progress of the project; and (2) to furnish more permanent information on mining costs for future use. The more important phases of operation on which permanent information is desired have been outlined in the form. There are blank lines, however, for those unusual phases which may need to be reported for a particular project. It will be necessary for the Operator to distribute his costs among the applicable phases reported with the exception of three items the costs of which are not to be distributed by the Operator. These three items are: "Operating Equipment Purchased", "Initial Rehabilitation and Repairs", and "New Buildings, Improvements, etc." The reason for not distributing these items on a monthly basis is doubtless clear to the Operator, since such distribution might well overstate the cost for any one month or period short of the entire contract period.

Form MF–104A has been designed to tie in with Form MF–104 for both monthly and cumulative costs. The "Total Costs" on Form MF–104A for each month should equal the monthly "Total Costs" as reported on Form MF–104. This is also true of the "Total Costs To Date".

In preparing Form MF–104A, it will be necessary frequently to distribute certain costs over a number of items. For instance, supervisory and engineering costs may have to be distributed over several phases, such as, drifting, crosscutting, raising, etc., provided that these items were reported active for the month. Such distributions should be made on the basis of time spent on the various phases, on man days of labor charged to such phases, or on some other equitable basis. "Operating Equipment", "Initial Rehabilitation and Repairs", and "New Buildings Improvements, etc.", will be distributed to the several phases of the project by the Washington Office of DMEA at the close of the project if determined necessary. The last two columns headed "Authorized by Contract" will be filled in by the Operator if such information is found in the contract. This information is usually a part of Exhibit "A" of the contract. A space for remarks has been provided for the use of the Operator to call attention to any unusual circumstances causing excessive or disproportionate unit costs.

WESTERN MONTANA EXPLORATION & DEVELOPMENT COMPANY, INC.

KEY-DURAND LEAD-ZINC Project No. DMA-946X I-DMA-E30

NARRATIVE Month of August, 1952

During the month of August all work done was confined to driving the South Drift in Lower Mesa No. 3 Level, with the exception of 4 hours trenching to finish that work for Mr. Glockzin, the geologist, and the regular camp routine:

A progress of 160 feet was made in the south drift, following a course approved by Mr. Glockzin. A major fault was cut as shown on the progress map, and as the drift was gaining farther east than was intended, Mr. Glockzin decided it best to follow the fault to the target area, directly under U.S. Bureau of Mines diamond drill hole No. 8A. A point 30 feet short of the target was reached on August 31, and on September 4, the face of the drift was directly under the target.

No ore was encountered in the drifting, although the formation is well mineralized and showing some sphalerite in the cleavage planes.

The drift is now being turned sharply to the east to crosscut the formation in that direction. Later a short crosscut will be driven from the same point, west through the fault to explore the formation in that direction.

It is the writers opinion that a raise should be started from the present face of the drift, to explore the formation between the drift level and the ore shown in the drill hole, a distance of 95 feet. This at least would prove what has happened to cut off the ore between the drill hole and the lower level.

It is not probably that the drill hole cut the bottom of the ore at that point, so it may not be necessary to raise all of the 95 feet before encountering the ore.

Dear Sir:

Your August MF-104, submitted in the amount of $5,510.83, has been approved for $5,494.98 and payment will be made in the amount of $2,747.49.

A deduction of $15.85 has been made under Item (7) Other, covering stamps, telephone calls, postage and statement forms. These items are considered overhead.

We have changed $125.43 from (7) Other to (3) Other, inasmuch as the purchase covered Diesel Oil for Air Compressor and Power Plant Operation.

Very truly yours

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(a) *Form MF-104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(b) *Form MF-104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(c) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF-104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF-104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF-200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF-200; and delete word "Independent" if the contract reported is on Form MF-200 (A). Also, report work paid for on a unit basis under contract Form MF-200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF-104 when submitted for reimbursable expenses incurred under contract Form MF-200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF-200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF-104 is required to be documented. The four copies of Form MF-104 are not to be thus supported.

Form MF-104 submitted for reimbursement under fixed price contracts on Form MF-200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF-104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

INSTRUCTIONS

Preparation of Form MF-104A—Operator's Unit Cost and Progress Report.—Applicable places on Form 104A should be filled in by the Operator. The purpose of this form is twofold as follows: (1) to furnish the supervising engineers and other administrators with statistical information necessary to better determine the progress of the project; and (2) to furnish more permanent information on mining costs for future use. The more important phases of operation on which permanent information is desired have been outlined in the form. There are blank lines, however, for those unusual phases which may need to be reported for a particular project. It will be necessary for the Operator to distribute his costs among the applicable phases reported with the exception of three items the costs of which are not to be distributed by the Operator. These three items are: "Operating Equipment Purchased", "Initial Rehabilitation and Repairs", and "New Buildings, Improvements, etc." The reason for not distributing these items on a monthly basis is doubtless clear to the Operator, since such distribution might well overstate the cost for any one month or period short of the entire contract period.

Form MF-104A has been designed to tie in with Form MF-104 for both monthly and cumulative costs. The "Total Costs" on Form MF-104A for each month should equal the monthly "Total Costs" as reported on Form MF-104. This is also true of the "Total Costs To Date".

In preparing Form MF-104A, it will be necessary frequently to distribute certain costs over a number of items. For instance, supervisory and engineering costs may have to be distributed over several phases, such as, drifting, crosscutting, raising, etc., provided that these items were reported active for the month. Such distributions should be made on the basis of time spent on the various phases, on man days of labor charged to such phases, or on some other equitable basis. "Operating Equipment", "Initial Rehabilitation and Repairs", and "New Buildings Improvements, etc.", will be distributed to the several phases of the project by the Washington Office of DMEA at the close of the project if determined necessary. The last two columns headed "Authorized by Contract" will be filled in by the Operator if such information is found in the contract. This information is usually a part of Exhibit "A" of the contract. A space for remarks has been provided for the use of the Operator to call attention to any unusual circumstances causing excessive or disproportionate unit costs.

WESTERN MONTANA EXPLORATION & DEVELOPMENT COMPANY, INC.

KEY-DURAND LEAD-ZINC Project No. DMA-946X I-DMA-E30

NARRATIVE Month of July, 1952

The progress made in the mine during the month of July consisted of driving 144 feet in the South Drift and 6 feet of Crosscut east from the south drift. This progress is shown on the regular monthly progress map accompanying this report.

The drifting was done in accordance with the recommendation of Mr. Albert R. Glockzin, Geologist, and approval of the DMEA field offices in Spokane, Washington.

Very hard rock was encountered in driving the drift, causing a considerable amount of drill steel breakage and taking from 40 to 50 drill bits to drill a 5 foot round of holes. We found it necessary to pay an additional 50 cents per foot to the contractors through this hard formation, making it cost $10.50 per foot for labor, instead of the regular $10.00 per foot we had been paying.

No ore was found in this 144 feet of advance. The drift will be continued to the target area, a point directly under U.S. Bureau of Mine diamond drill hole No. 8A.

The 6 ft. of Crosscut East was driving at a point in the South drift just south of survey Station No. 8, for the purpose of exposing the ore for sampling at this point. This is the same ore showing all along the South Drift up to this point, and which was cut in Crosscuts Nos. 1, 2, & 3 East.

In addition to the above work underground a total of $1404.62 was spend for Surface Trenching for Mr. Glockzin, the Geologist, in connection with his geological survey of the mine.

This work consisted of cutting down in Trench No. 14 to expose a 12 to 20 foot face across the trench and expose the footwall for a length of 80 feet.

A new Trench No. 12½ was made just north of Trench No. 13 which took considerable bulldozer time because much of the muck from Trench No. 13 had to be removed to get a 12 foot face and expose the footwall in the new trench.

Trench No. 12 was made much deeper and wider near Mass No. 1 Adit Level to better expose the formation at that point.

All other rountine work is shown on the cost sheets for the

MONTHLY REPORT OF OPERATOR

The Operator (Contractor) of an exploration project is required to make a monthly report to the Government through the Regional Executive Officer. This report consists of three parts as follows:

(a) *Form MF-104—Operator's Monthly Report and Voucher.*—This form details expenditures and constitutes a voucher for reimbursing the Operator for the Government's share of costs;

(b) *Form MF-104A—Operator's Unit Cost and Progress Report.*—This is a statistical report of expenditures which shows costs for the various types of operation; and

(c) *Narrative.*—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered must be furnished as an attachment to this Report and Voucher. Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

The Monthly Report of Operator should be prepared in an original and four copies all of which must be sent to the Executive Officer of the Region not later than the 15th of the month following.

Preparation of Form MF-104—Operator's Monthly Report and Voucher.—All the applicable spaces in Form MF-104 should be filled in by the Operator, and the Operator or his agent should sign the certification in the lower left corner of the form.

The items of costs are arranged in the order they appear in Article 6 (a) of Form MF-200 (Revised February 1952), however, this form is readily adaptable for use in reporting activities under other contract forms.

Under Item (1) delete words "Short Form" if the contract is a sub-contract under Form MF-200; and delete word "Independent" if the contract reported is on Form MF-200 (A). Also, report work paid for on a unit basis under contract Form MF-200 as though it were performed under an independent contract.

Under Item (2) include labor, supervision and technical services incurred for the exploratory operations. Do not include labor, supervision and technical services used for work performed under items (5) and (6).

Under Item (3) include the costs of material and supplies used in the project other than that used under items (5) and (6).

Under Item (4) appear the three types of operating equipment expenditures, that is, rental, purchase and depreciation. The expenditures made for renting equipment belonging to a third party will be reported under "Rental". The amount paid or duly obligated for payment for the purchase of equipment will be reported under "Purchase". The amount of expenditures due the Operator to reimburse him for depreciation of equipment owned will be reported under "Depreciation".

Item (5) comprises costs of labor, supervision, technical services, materials, etc., which are used in the initial rehabilitation and repair of existing buildings, installations, fixtures, and equipment. These costs, therefore, should not be reported under items (2) and (3).

Item (6) includes the labor, supervision, technical services, materials, etc., used in the installation or construction of new buildings, fixed improvements, etc., necessary for the project. These costs, therefore, should not be reported under items (2) and (3).

Item (7) covers miscellaneous types of expenditure such as payroll taxes, liability insurance, workmen's compensation insurance, repairs to equipment and sampling and analysis. Only that part of payroll taxes, liability insurance and workmen's compensation which are paid by the operator should be reported under item (7). The share paid by the employee as a payroll deduction is to be included under item (2) as labor costs.

Item (8) includes any unforeseen costs not included in the other seven categories.

The original of Form MF-104 when submitted for reimbursable expenses incurred under contract Form MF-200 must be supported by original documentation or by certified copies of purchase orders, payrolls or transcripts of payrolls, unless such documentation has been waived by the Regional Executive Officer. This certification may be stated thus, "Certified True Copy (or Transcript)", followed by appropriate signature. If the Executive Officer of the Region determines that a contract under Form MF-200 should have an "on-site" audit, that is, a Government auditor should make an audit of the Operator's books and records of account, the Operator need not support his monthly voucher with original or certified documents except in cases of equipment purchases whose individual costs exceed $50.00. In these cases the original or a certified copy of the purchase order or invoice should be attached to the Monthly Voucher. N. B.—Only the *original* of Form MF-104 is required to be documented. The four copies of Form MF-104 are not to be thus supported.

Form MF-104 submitted for reimbursement under fixed price contracts on Form MF-200 (A), however, are not required to be supported by documentation of any kind. The Operator will submit his claim under item (1) of Form MF-104 by deleting as stated above the word "Independent" and by showing the number of feet or other units immediately after the appropriate descriptive word, such as, drilling, bulldozing, crosscutting, drifting, etc., and giving the "Monthly Total" amount due. "Totals Previously Reported", and "Totals to Date" columns should also be filled in.

DMA-946X
I-DMA-E30

NARRATIVE FOR JUNE 1952

The progress made in the mine during the month of June consisted of driving 124 feet of Crosscuts as follows:

Crosscut No. 3 East was driven 49 feet making a total of 239.5 feet at which point the hanging wall of the ore zone was reached. Lenticular masses and stringers of good ore were encountered throughout the 49 feet advanced, and 3 feet or ore assaying 8.67% zinc, 0.21% lead and 0.40% copper was found next to the hanging wall.

Crosscut No. 1 West was started at a point 81.25 feet south from Crosscut No. 2 East (see progress map) and was driven a net distance of 57 feet west from the South drift. In addition to the 57 feet driven, two side-swipes of 3 feet each, to make room for the track switch were paid for on the contract making a total of 63 feet in this Crosscut. This West Crosscut was driven to explore the West side area of the South drift on the chance that the dip of the ore shown on the footwall in Trench No. 13 had steepened and therefore was on the West side of the drift. No ore was found other than some mineralization in the fractures of the formation. This area will be explored further by drilling a long test hole from the face of this Crosscut with the Ingersoll-Rand DA-35 Drifter Drill.

Two 6 foot Crosscuts were driven at points shown on the progress map to cut the ore encountered in driving the South drift, one on the West side of the drift and the other on the East. A third one was started on the East side but not finished for this report. These short Crosscuts were driven to determine the width of the ore at these points and provide faces from which adequate samples could be cut.

The Portals of the Wasa Nos. 1 and 2 Tunnels being in a very bad condition from rotting of the timbers and caving ground, damming the water and cutting off ventilation in the underground workings, we removed the obstruction by bulldozing. This work was done at a total cost of $148.78 which includes the rental of the tractor and dozer. This work is not covered under our DMA Contract, but should have been provided for.

A total of $632.02 was spent on clearing and logging off the Mill building site. This item also is not covered under our DMA Contract and is therefore deleted on the report.

DMA-946X
I-DMA-E30

Narrative for June 1952, cont.

The services of a consulting Geologist having been recommended and approved by the Field Office of the DMEA, and our contract amended to cover this service, Mr. Albert R. Glockzin of Missoula, Montana was employed to make a thoreugh geological survey of the property in an endeavor to solve the problem of what happens to the ore between Trench No. 13 and the South drift of Lower Wasa No. 3 Level.

Mr. Glockzin receives a salary of $750.00 per month for his services, which together with the other expense of an assistant and bulldozing for making exposures on the surface, all necessary for this survey, a total of $1189.58 was expended during the month of June. The results of this survey so far is most encouraging, and it is believed will solve our problems underground and open up large bodies of commercial ore when completed.

Memorandum to: Western Montana Exploration & Development Co.
412 Western Bank Building, Missoula, Montana

From: W. Eulon Lee, Fiscal Officer,
U. S. Bureau of Mines, Albany, Oregon

Subject: June voucher for contract Idaho-30

We are passing your June monthly report and voucher in the amount of $2,444.07, as it has been approved for a total of $1,930.15.

We have deleted items 3 and 7 as follows:

Item 3	Drilling & Misc.	$123.90
Item 7	Misc. Other	457.17

We have not been able to verify the above amounts from the distribution of expenses on your distribution sheet. These items may be reclaimed on a supplemental report and voucher form. Please substantiate this supplemental report with a detailed itemization showing how each of these amounts was computed.

To U. S. Bureau of Mines,
1201 N. Division St.,
Spokane, Washington

M. E. Volin, Member, DMEA Field Team, Reg. II June 13, 1952

Glenn C. Reed, Mining Engineer, Bureau of Mines

Routine inspection, Contract Idm-230, Key-Durand, Granite County, Mont., Docket 946 (lead-zinc)

The above indicated contract operation was inspected in company with Frank Hancock, superintendent, on May 17, 1952. Since the previous inspection date (March 7, 1952) 195 feet of crosscutting and/or drifting has been completed for an aggregate of 939 feet.

Although standards of work are considered excellent, performance on a unit cost basis is low. Nevertheless, the Operator is making a consistent effort to maintain a "clean shop" and to date is meticulous in observance of the state mine safety code. Inasmuch as geologic control of the operation appears inadequate, it was suggested that a consulting geologist be retained on approval of an appropriate contract amendment by the Executive Officer. This step has been taken and a detailed mapping campaign currently is in progress.

Work to date has resulted in the probing by crosscutting at four places of a strong mineralized shear zone disclosed by earlier surface trenching and diamond drilling. Although the three intersections of this zone seen to date contain no minable ore at the horizon scope, they are considered encouraging. A recent communication from the Operator indicates that the fourth crosscut on penetrating this shear showed an ore face assaying about 8 percent zinc. This showing may be analogous to material exposed earlier by surface exploration.

It should be noted that the greater part of the contract allotment will have been expended at the expiration date on June 28, 1952. The original program, however, will not have been completed. Inasmuch as results to date appear encouraging from an exploration standpoint, an appropriate extension of the program should be anticipated and a justification prepared in support of a request for additional funds.

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

CERTIFICATION

The undersigned company, and the official executing this certification on its behalf, hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

NARRATIVE FOR MAY 1952

This month brought better weather conditions and surface snow was well gone by middle of the month, although some snow remained in deeper trenches (USBM Project 15-197) until latter part of the month.

Our crosscut No. 3 East was advanced 126 feet some of which was made through very hard quartzite formation. At approximately 181 feet east of starting point in South drift the crosscut intercepted a fault zone of similar character as in crosscuts 1 and 2 East. See progress map. First part of this fault zone was fairly well mineralized but without as much ground water as in XEC 1 and 2. However, XEC 3 has now, by this writing (June 9, 1952), been advanced some 30 feet since first of the month and has entered a heavily mineralized area with the usual amount of ground water. Ore in face now is a true zinc sulphide and appears to be the best ore we have encountered so far in the development program. Engineer Hancock will cut representative samples soon for assay.

On surface such work was accomplished as leveling off site for new cook and boarding house construction and cleaning out old USBM trenches for further study by consulting geologist toward an effort to correlate findings underground with areal geology previously discussed and reported by Mr. C. C. Popoff in his report on U. S. Bureau of Mines Project 15-197.

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

DEPARTMENT OF THE INTERIOR
Defense Minerals Administration

DAA-946X
I-DA-530

NARRATIVE FOR April, 1952

Progress for this month was somewhat low when considered on a strickly footage basis which was due to very hard formation encountered in Crosscut No. 3 east and to certain other measures which had to be carried out during this month, namely side swiping to start XXC3 and XXC1 and the installation of ventilating fan and several hundred feet of fan bag-16" and 12" in size. It was also necessary to replace several sets of timber in South drift and to crib up over 2 long sets in Wasa No. 3 or Lower Tunnel, the latter due to sloughing from increased flow of ground water at this season of the year (Spring thaw).

The Wasa Tunnel, South drift and all crosscuts are now in good condition and appear in a more efficient state. Present contract miners are the best work men we have employed so far on this project.

Roy W. Ley

SETTLEMENT SHEET

MINE DEVELOPMENT CONTRACTS- Month April, 1952

Charge Item No. 2b, Key-Durand DMA Contract:

To starting No. 1 Crosscut West, (Side Swipe) 3 feet @ $10. per ft.	$ 30.00
To starting No. 3 Crosscut East, (3 side swipes) 9 feet @ $10. per ft.	90.00
To driving No. 3 Crosscut East 40 feet @ $10. per ft.	400.00
To driving No. 3 Crosscut East 20 feet @ $12. per ft.	240.00
Total for 72 feet Crosscuts	$760.00

Recap:

Item No. 2b to driving 3 ft. in No. 1 Crosscut West	$ 30.00
Item No. 2b to driving 69 ft. in No. 3 Crosscut East	730.00
Total	$760.00

Paid Contractors as per April, 1952, Payroll:

Jack A. Parks	1½ days work @ $17.15	$ 25.72
Willard Barrett	2 days work @ $17.14	34.28
Chas. F. Turner	15 days work @ $23.333	350.00
W. L. Nichols	15 days work @ $23.333	350.00
	Total	$760.00

Note:

20 feet of driving in No. 3 Crosscut East was paid for at $12.00 per foot due to the very hard rock encountered. This hard formation required almost double the length of time to drill the round; not only was it slow drilling, but more holes were required to break the ground.

In starting crosscuts from the drift it is necessary to widen the drift by side swipes to gain sufficient room to make the turn into the crosscut; also to have room for a switch in the track for the mine cars.

Government Participation: 50 % Amount, $ 5654.68
Distribution of Expenditures for Month of March, 1952

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

CERTIFICATION

The undersigned company, and the official executing this certification on its behalf, hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

NARRATIVE FOR MARCH 1952

Progress for March was fairly good despite 2 days lost on account of heavy wet Spring snow which caused trouble in keeping outside track clear enough for muck cars to reach dump track. Two sets of timbers had to be replaced in South drift on account of lagging giving away to slow sloughing of wall enough at one point to disarrange the standing timbers and caps.

The heavy Spring snows necessitated some road cleaning as well as snow removal from around camp and shop buildings by use of the D-6 tractor-dozer. Older residents of Hall, Montana and vicinity state that not in their memory has this ~~vicinity~~ area received so much snow as during past winter. The graded dirt road from Highway 10-A to mine started to break up last week in March due to thawing and at present writing we have much mud to contend with. The "breakup" of road was anticipated and for this reason supplies such as rail, pipe and Diesel fuel were purchased in a slightly higher quantity than usual in order to get these items into camp before the Spring thaw.

Of particular interest during the month was the interception of an entirely different type of fair zinc ore in face of South drift "under" Trench No. 13. Whether or not this is one part of the large vein seen on surface at Trench No. 13 has not been determined for sure, but Engineer Hancock feels it is the deepest or most westerly ore found in U. S. Bureau of Mines Diamond Drill Hole No 8A, (see progress map). In any event an easy turn was made in the drift to left or to East and this crosscut will either prove or disprove our ideas about the new ore.

UNITED STATES
DEPARTMENT OF THE INTERIOR
DEFENSE MINERALS ADMINISTRATION

Contract No. 30
Idm-E

Name of Operator Rey-Laurend
Docket No. DMA 9406
Total Contract Amount $ 66[illegible]0.00
Government Participation: 50 % Amount, $ 4099.71
Distribution of Expenditures for Month of February, 1952

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

Defense [illegible]

MAR 3 - 1952

CERTIFICATION

The undersigned company, and the official executing this certification on its behalf, hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

[1] Prorate supervisory, engineering, and office salaries in proportion to man-shifts of direct labor.
[2] Prorate charges for equipment that is not exclusively for one type of job (such as compressors) against authorized units of work in each category.
[3] Where entries in the "Other" column (above) are more than 25 percent of the total expenditures, a breakdown of this item should be made.
[4] Specify whether feet, cubic feet, acres, miles, etc.

16—64068-3 U. S. GOVERNMENT PRINTING OFFICE

DBA-9461
I-DBA-530

Narrative for February 1952

Poor progress due to short month and lost time while making repairs to Ai Compressor.

Also two days work was lost in mine while moving Air Compressor and other ment into the new mine shop building and laying a new air line from the shop bu to mine.

Due to the warmer weather and the heavy flow of water at the working faces mine, there was much sloughing off the walls in the main adit tunnel and consid work entailed in keeping the drainage ditch and tracks clear for the mine cars the south drift and crosscuts, which work is not covered in the contract for dr at the faces and has to be done by the general labor under days pay — hence th cost for mine haulage.

Total advance for month is as follows: South Drift - 36 feet, Crosscut No 8 feet, Crosscut No 2 East - 39 feet, Total footage - 83 feet.

The No 1X cut east has been timbered to the face. 10-5 foot sets have bee in and cribbed to the roof where caved. It was found necessary to do this work it was caving badly in the ore between the faults on the footwall and hanging w

The cost for doing this work included drilling and blasting the walls to m room for the timbers and cribbing over the sets of timber to hold the roof wher Two sets of cribbing were over 6 feet high.

The cost also included cutting the logs for cribbing in the works and hauli them in.

The first 6 rounds in ore of Crosscut No 2 East were sampled from top to b of the face with following results (Footwall toward East):

1. 0.30% Copper, 0.16% Lead, 9.15% Zinc
2. 0.15% Copper, 0.11% Lead, 2.35% Zinc
3. 0.20% Copper, 0.11% Lead, 2.78% Zinc
4. 0.40% Copper, 0.27% Lead, 5.08% Zinc
5. 0.60% Copper, 0.27% Lead, 0.38% Zinc
6. 0.80% Copper, 0.22% Lead, 0.38% Zinc

During the month we had demonstrated to us a Sandvik drilling outfit using Coromant carbide tipped steel of various lengths. This Swedish outfit put in a of holes in about 1/2 time required for our own R48 Stoppers. During month of M we expect to have demonstrated a Le Roi-Cleveland 2 way air feed sinker drill wh a somewhat heavier machine than the Swedish Sandvik outfit. However, the Sandvi has several points which make it attractive for our as yet small operation.

36 feet @ $10.00 per foot — $360.00

Charge Item No. 2b, Key Durand LEA Contract:
To driving No. 2 Crosscut East from South Drift
39 feet @ $10.00 per foot — $390.00
To driving No. 2 Crosscut East from South Drift
5 sets timber @ $10.00 — 50.00
Total for 75 feet driving — $800.00

Recap:

Item # 2a To driving 36 ft. in South Drift @ 10.00		$360.00
Item # 2b To driving 39 ft. in No.2 Crosscut @ 10. & $12.		440.00
	Total	$800.00

Paid Contractors as per February, 1952, payroll:

Jack A. Parks, 20 days work @ 20.00	$400.00
Willard Barrett, 20 days work @ 20.00	400.00
Total	$800.00

Note:
The contract price for driving a 5' x 7' tunnel without timber is $10.00 per foot, and $12.00 per foot timbered. The sets of timber are stood 5 feet from center to center, so there is one set for each 5 feet of tunnel. More ground has to be broken where timbered to make room for the sets. The difference in price for with or without timber is $2.00 per foot of tunnel so for each 5 foot set of timber the price is $10. per set. When a tunnel is driven without timber, and at a later time is found necessary to timber it, because of caving or sloughing of the roof or walls, the cost is greater because the roof and walls usually have to be drilled and blasted to make room for the sets.

Distribution of Expenditures for Month of January, 1952

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

Narrative for January 1952

Despite rather severe winter weather and an unusual amount of snow fall during January, 108 feet of advance was made underground -- 62 feet as crosscuts and 46 feet as progress of drift southward and nearer Trench 13 territory. It was necessary to go back and timber the mineralized zone in XEC1 and to timber the mineralized portion of XEC2 already cut. Both these mineralized zones are making much water, so much as to require that the operators furnish miners with rubber clothes for health and comfort. It was necessary for operators to twice plough out road from workings to highway at phosphate mill.

It is noted that somewhat better ore is found toward bottom of XEC2 than at top of the cut; this condition thought to be due to mineralization being deposited in layers as is often seen in large veins or mineralized shear zones. The face of drift is becoming increasingly mineralized and a number of brown streaks along small water courses are noted. Engineer Hancock has directed drift to swing slightly to west or to the right as it is predicted that directly under Trench 13 or some 100 feet south thereof the formation will change considerably and show a more definite "wall" structure.

At present writing (February 8) the new mine shop building is complete. Montana Power Company is doing preliminary engineering work toward installing electrical power (500 H P) at our workings.

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

CERTIFICATION

The undersigned company, and the official executing this certification on its behalf, hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

Narrative for December, 1951

COPY

December produced only a minimum amount of progress on this project. Severe winter weather set in about December and this coupled with Seasons Holidays saw only 88 feet of advance underground in the form of extending South drift to 100 feet farther in from XCE 1 and the start of XCE 2. The formation changed decidedly between these two crosscuts in that definite planes appeared in the limestone, such planes being somewhat flat but dipping from South to North as was predicted by Mr. G.C. Popoff in a private conversation.

Engineer Francis A. Hancock is preparing a longer map of the Shamrock Area and will show the position and gross findings of United States Bureau of Mines diamond drill holes No. 8A and 10, both of which cut the Shamrock "Vein" at a dip of minus 45 degrees and bearing West. These two holes are 1175 feet apart and in the same North-South line.

Our South drift is now approaching Trench No. 13 territory which is approximately 200 feet North of Diamond Drill hole No. 8A.

Labor on Mr. Hancocks Distribution Sheet	$3458.15
Add cooks labor for September	26.00
July	180.00
	$3664.15

October and November cooks labor deletions are corrected on November Voucher form No. MF 104.

Narrative for November, 1951

During month of November we saw the completion of two points which are of interest and the starting of a third item which will be of some importance, namely the construction of a 18' x 40' heated wooden building which will house compressor, D-6 tractor and dozer, provide adequate shop space and change room for miners (dry room).

The completion of 1.62 mile of new Forest Service specification road from Phosphate mine to intersect previously constructed road just above Forest Service administrative cabin on Douglas Creek will greatly improve ingress and egress to Durand Lead-Zinc Claims during both winter and summer.

The completion of first crosscut to east in Shamrock Extension ground revealed a well mineralized Shear Zone some 52 feet wide on a dip of 30° E, which if corrected for the dip gives us a vein of approximately 26± feet in width, which will shortly be correctly sampled (12 samples) by Engineer Hancock.

At this writing (December 15th) we have started second eastward crosscut 100 feet south of No. 1 crosscut off our southward drift into Trench 13 - 14 Country. Indications are now present which would cause us to beleive mineralized shear zone is swinging to west and is nearer than 24.5 feet from south drift.

Respectfully,

Roy W. Key

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

CERTIFICATION

The undersigned company, and the official executing this certification on its behalf, hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

Progress Report
Month of September, 1951

Narrative

A brief description of the work accomplished and progress made during the period September 1st to September 30th (inclusive) is as follows:

The drift continued for approx. 111 feet during September. Line of advance continued in fault zone and we found that we are following the foot wall of that fault zone and the Shamrock ore body. The right side wall of the drift remained fairly constant in dipping 45-[illegible] degrees to east until last 15 feet when the fault formation seemed to rotate on its horizontal axis and became almost flat! - 10-12 degrees slant or dip still to east. Several small lenses of [illegible] (1-[illegible] inches) were seen thru out the drift running parallel to direction of advance or moving over to "hanging wall" of the fault zone. Ground is of such nature as to require timbering all the way - 22 sets of timbers with almost solid lagging top and sides. However, where the formation "flattened out" it became much firmer and the amount of ground water decreased somewhat.

Small progress was made due to heavy ground, timbering, poor labor and lack of good miners.

Under item 2: There is a labor charge of $210.95 for cutting, logging and hauling fine timbers and lagging material for at least 75 sets of timbers of which 25 sets were used during the month. This was undertaken in order to get some timber ready for the winter months and before the winter snow sets in. There is 1[illegible] hours at Tractor rental at $[illegible].00 per hour charged to this work in addition to the labor charge above.

Under item 3: 5 hours of bulldozing was done in trench 13 to better expose Shamrock vein on its foot wall and to be able to correlate the south drift underground with surface exposures. The tractor and dozer was used also, a total 5 hours during the month, to push and level down dump to keep it clear for dumping ore from mine.

Roy W. Kay

METHOD OF OR ABSENCE OF ADVERTISING

(Section 3709 of the Revised Statutes)

1. After advertising in newspapers.

2. (*a*) After advertising by circular letters sent to _____ dealers.

   (*b*) And by notices posted in public places.

   (If notices were not posted in addition to advertising by circular letters sent to dealers, explanation of such omission must be made. The notation on the certificate on the face of the voucher must be "2(*a*)(*b*)" or "2(*a*)", depending on whether or not notices were posted.)

3. Without advertising, under an exigency of the service which existed prior to the order and would not admit of the delay incident to advertising.

4. Without advertising in accordance with _____

5. Without advertising, it being impracticable to secure competition because of _____

_____

_____

_____

_____

(Here state in detail the nature of the exigency or circumstances under which the securing of competition was impracticable under 3 and 4)

NOTE.—The above form "Method of or Absence of Advertising" is to be used when purchases are made or services secured under proper authority without written agreement in any form. In case of a written agreement (formal contract, proposal, and acceptance, or less formal agreement) Standard Form No. 1036—Revised should be used for abstracting the method of or absence of advertising and award of contract. STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

DEFENSE MINERALS ADMINISTRATION WASHINGTON, D.C.

CERTIFICATION

The undersigned company, and the official executing this certification on its behalf, hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

Government Participation: 50 % Amount, $
Distribution of Expenditures for Month of 6/28 - 7/31, 1951

STRATEGIC AND CRITICAL MINERAL EXPLORATION PROGRAM
OPERATOR'S MONTHLY PROGRESS REPORT

Operators are to submit monthly reports to the designated field representative of the Defense Minerals Administration. Reports are to be submitted in quadruplicate prior to the 15th day of the month following the reporting period.

Narrative.—A concise narrative description of progress made, results accomplished, and any unusual difficulties encountered is to be furnished.

Maps.—Wherever possible, the narrative is to be illustrated with maps or sketches showing formations penetrated and location and assays of samples taken as well as advances in workings. In the case of diamond drilling or churn drilling, the location and inclination of holes is to be shown on a map; logs and assays also are to be submitted.

Cost Accounts.—All applicable parts of this form are to be filled in. This report will form the basis for payments of the Government's participating share of expenses. Audits of accounts may be made from time to time.

WESTERN MONTANA EXPLORA
& DEVELOPMENT CO. INC.
412 WESTERN BANK BLDG.
MISSOULA, MONTANA, DMEA-946X,
I-DMA-E30, DMPA-2461

STRATIGRAPHIC CONSIDERATIONS

The upper Paleozoic and Mesozoic stratigraphic section in the vicinity of the Vasa-Shamrock ore body consists of the Madison, Amsden, Quadrant, Phosphoria, Ellis, Kootenai and Colorado formations. The currently observable ores are entirely within the Kootenai formation. Some of the ore is metasomatically associated with the Lower Limestones of the Kootenai. Thus, the continuity of these Limestones is of utmost importance in predicting the probable southern extension of the ore body.

Kootenai Formation

Owing to the fact that the Kootenai at the mine is metamorphosed and intensely disturbed structurally, two sections of the formation were measured. One composite generalized section was obtained along Gird Creek, four miles west-southwest of the mine, and in the vicinity of Mt. Princeton, four miles southwest of the mine. The other section was measured about 10 miles to the northwest along the facies strike in the vicinity of Bulky Gulch.

Bulky Gulch Section:	Thickness
8 - Upper Shale unit eroded.	
7 - Gastropod or Upper Limestone, poorly fossiliferous, only the lower few feet exposed.	
6 - Shale, grey, red, maroon, green, few thin sandstone and siltstone beds, few limestone lenses and nodular layers, limestone locally crystalline.	600'
5 - Lower Limestone, locally well bedded, dark grey to black, dense, with interbedded shales.	200'

4 - Shale, red, grey, etc. like unit 6.	200'
3 - Shale, red, grey, with interbedded siltstones. 10' bed of sandstone at the top and bottom.	60'
2 - Shale, grey, olive, with interbedded siltstone.	75'
1 - Conglomerate and pebbly sandstone.	10'
Total thickness from base of Gastropod Ls.	1145'

Bird Creek - Mt. Princeton Section:

8 - Shales, red to black, with some sandstone.	100'
7 - Gastropod Limestone, with much interbedded shale.	200'
6 - Shale, red, green, maroon, with some interbedded flaggy sandstone, very little limestone lenses and nodules.	700'
5 - Lower Limestone, lenticular, nodular, poorly bedded, discontinuous.	15'-
4, 3, 2 - Shale, red, green, maroon, with interbedded siltstone and sandstone, very few limestone stringers and nodules.	400'
1 - Conglomerate and pebbly sandstone.	15'
Total thickness -	1430'
Total thickness from base of Gastropod Ls. -	1130'

It will be noted that the stratigraphic interval from the base of the Gastropod Limestone to the base of the formation at the two localities is almost identical, that the formation is more calcareous and less clastic to the northwest and less calcareous and more clastic southeast along the facies strike, and that the Lower Limestone looses its continuity and is locally absent.

Metamorphism of the Kootenai

The ore body is stratigraphically associated with the Lower Limestone unit and the shales above and below. In the vicinity of

the mine the Kootenai shales have been metamorphosed to hornfels and the limestone to silicated marble. The paucity of marble and the over-abundance of hornfels further attests to the decrease of lime content along the regional facies strike in this area.

Locally some of the limestone has been so intensely silicified that it possesses physical characteristics very similar to the hornfels and in this case can only be recognized by its effervescence. Bedding planes and joints have been healed by the metamorphism, the rocks have been made much more competent and hence have been very intensely fractured. Thus, it is practically impossible to determine the attitude of the bedding planes in the Kootenai. Furthermore, it is suspected that the silicification of the limestones may have locally been so intense that carbon dioxide has been lost, complex calcium rich silicates formed and mixed with hornfelsized argillaceous material.

Near the middle of the south drift extended (see last monthly progress map) the hornfels contain metamorphosed lime nodules a few inches in diameter which are shot through with pyrrhotite and little chalcopyrite and sphalerite. The selective replacement of the limestone lenses and nodules is typical of that portion of the mineralization which is attributable to metasomatism of the limestones.

It is concluded that that portion of the total mineralization caused by metasomatism of the limestones is only in small amount, and that ores of this origin will decrease in quantity to the south.

IGNEOUS RELATIONS

Three and one-half miles due south of the mine is a stock-like

COPY

body of granitic material which was called Granite by Emmons and Calkins[1]. However, upon examination with the hand lens it is obvious that the ratio of orthoclase to plagioclase is about 1 to 2.2 and this together with the abundant quartz classifies the rock as a granodiorite. Since the sedimentary beds strike nearly north-south metamorphism and mineralization seem to have spread north-south rather than across the bedding by east-west fracture control. Granodiorite is a favorable parent igneous material for ore mineralization and its presence at depth below the Wasa-Shamrock ore body is most probable.

Possibility of Ores at Depth

Contact metasomatic ores may occur at depth. In the Ellis formation about 300' below the Kootenai are several thin crystalline limestones which may be mineralized. However, the top of the thick Madison limestone is only about 700' stratigraphically below the Kootenai and is the best possibility relative to deep mineralization.

Inferences from the Gossans

Even though the depth of oxidation is very shallow the vein outcrops are almost completely oxidized, there being only a few small concentrations of relict sulphides. These local concentrations together with zinc sulphate unleached remnants account for the few assays from the gossans which show zinc in quantities greater than one percent.

The gangue in the gossans in mainly quartz which possesses the

---

Emmons, W.H. and Calkins, F.C., 1913; Geology and Ore Deposits of the Philipsburg Quadrangle, Montana; U.S.G.S. Prof. Paper 78, 271 pp.

appearance of the typical fissure filling type. The gangue is generally inert and the voids produced by sulphide leaching and oxidation are empty and the limonite has been transported. Owing to the presence of local concentrations of porphyroblastic pyrite in the hornfels and some micro-porphyroblastic feldspar, the gangue locally is reactive giving rise to boxworks with indigenuous limonite. Though few in number some of the boxworks show faint vestiges of the fine cellular to cellular sponge types so characteristic of sphalerite. However, the major point here to be emphasized is the paucity of both the voids produced in inert gangue and the boxworks produced in the moderately reactive gangue. Therefore, at the present level of erosion within the Shamrock ore body, very little sphalerite was originally deposited.

SUMMARY OF STRUCTURE

It is thought that structural control of mineralization is dominant, that most of the bodies are fault-fissure fillings, and that metasomatism of the limestone is minor.

The total structural analysis indicates that the Kootenai section in the vicinity of the Mass-Shamrock ore body was:

1. Anticlinally folded.
2. Tilted, thus producing northward plunge.
3. Overturned and isoclinally tightened by back thrusting from the east.
4. Folded into an eastward concave recess relative to the Philipsburg overthrust (or a westward convex salient relative to the back thrusting).
5. Torn by the East Gossan Fault Zone (and probably other faults)

accompanied by some strike slip so that the northeast block moved southeast.

6. The hanging wall block(s) fractured nearly vertically thus producing the fissures for the emplacement of the mined out portion of the Wasa ore body.

7. Throughout the above the structure was metamorphosed, wrinkled, crinkled, shattered and literally shredded thus producing a structural knot capable of receiving mineralization.

The writer has presented a summary of his conclusions as of July 10, 1952 in a report entitled "Progress Report No. 1 on the Geologic Analysis of the Wasa-Shamrock Ore Bodies" which contains and enclosed map illustrating the structural concepts. Since that date the writer has visited the property six times, three each in July and August of 1952. Since July 10, 1952 the following recommendations then submitted have been accomplished:

1. That the south drift be continued to a point near coordinates 9000E and 8900N, a distance of about 280' and bearing S20E. From this point, according to the dictates of the geological picture, 120' of east or west crosscutting or raising is to be recommended at the appropriate time. Raising was recommended, 100' having been completed prior to the winter shutdown.

2. 85' of the 500' of diamond drill hole recommended, this being accomplished from the top of the raise.

Since July 10, 1952 the following recommendations then submitted have not been accomplished:

1. Detailed mapping at a scale of 20' per inch of all existing underground workings of the Wasa Mine.

2. A 50 foot horizontal diamond drill hole bearing S70W from the end of the No. 1 cross cut west.

3. 4.5' of diamond drill hole in a series of short holes from the underground workings in the vicinity of Hole 8A and in the vicinity of the three east cross cuts, the latter to test the theory of intersectional ores.

The exploration in the south drift extended and in the raise from its southern extremity accomplished since July 10, 1952 has not changed the structural opinions of the writer as recorded in the First Progress Report. The additional data obtained is insufficient to confirm, deny, augment or revise the structural conclusions previously expressed.

The vertical fracture and/or fault zones which occur in the middle of the No. 3 cross cut east(see maps previously referenced) were encountered in the south drift extended within 15' of their predicted position. The last one encountered is the stronger, strikes N10E, dips 80W, exhibits dip slip as indicated by slickensides and appears to have been normal. It is well marked by a strong well and by sticky fibrous gouge throughout the entire drifted distance of 140'. No mineralization was encountered. In a S10W direction at a distance of about 150' it should intersect the West Gossan fault Zone with ore shoot relations. This is the only major structural feature revealed by the last explorational phase.

After the writers last visit to the property and immediately prior to the winter shutdown, he was informed that the last round blasted in the raise encountered bore hole 8A and revealed 3' of hard ore. The attitude of this ore is unknown. If the concept of

fault-fissure filling in the hanging wall block of the West Gossan Fault Zone is tenable, this ore should continue to the south and become richer as the West Gossan Fault Zone is approached. If this ore is metasomatic and approximately parallels the West Gossan Fault Zone, its southern continuity is questioned.

SUMMARY

If the ore in hole 8A and encountered at the top of the raise is metasomatic, it is predicted that the southward extension of the ore will be discontinuous.

If the ore is of the fissure filling type, it is predicted that the southward extension of the body will be continuous.

It is recommended that this body be drifted upon to the southward as soon as possible. This final exploration should prove or disprove the possibility of the mine at this level.

It is predicted that an ore shoot exists at the intersection or adjoinment of the West and East Gossan Fault Zones as indicated on the map enclosed with the First Progress Report. This shoot should be explored by the appropriately located underground bore holes.

After the attitude of the ore revealed at the top of the raise is determined, the body should be projected toward possible intersections and probed with bore holes for possible ore shoots.

Deep development and exploration should be curtailed until all possiblities have been exhausted withing the present levels.

KEY-DURAND LEAD-ZINC PROJECT NO. LMA-946X-I-DMA-E30

FINAL REPORT

In submitting a final report on this project the writer has prepared a complete cost sheet, showing distribution of all the money expended from the time Dr. Roy M. Key, of Missoula, took over control of the property from Mr. Oscar J. Durand of Hall, Montana.

This cost sheet includes expenditures not covered under the LMA contract participation, but for our own record it was deemed advisable to show the total amount of money spent.

From this distribution of the cost, the items in which the Government participated can readily be ascertained by checking with the monthly reports submitted under the LMA contract. Our distribution of costs do not conform altogether with the monthly reports submitted, due to the fact that we endeavored to keep an accurate cost of the various phases of the work being done, and therefore, it was necessary to show more items on our distribution.

In commenting on the cost of the work accomplished on this project it seems only fair to state that the cost was in most cases far too high. This was due to several causes, which stated briefly, were lack of accommodations to house a sufficient number of men to work more than one eight hour shift in the mine; excessively high rental paid for mining equipment; inadequate equipment to do the work economically.

The sum of $6000.00 was requested for housing and camp facilities in the original application for a LMA loan contract, which would have provided proper and comfortable living and boarding conditions for an adequate crew of men for a three shift per day operation in the mine and thereby, reduced the cost considerably.

In submitting the cost of $26.00 per foot for drifting and cross-cutting an error was made in stating that it included rental of equipment. The writer worked out this figure, and it included the cost of labor, supplies, explosives, diesel fuel, rails, ties, pipe, etc., but not equipment rental because it was assumed that the partnership or company would supply it through ownership.

A jumbo for the drifter drill would have saved considerable money over drilling drift rounds with the stoper drill. Only short rounds was possible with the stoper, and the breakage of drill steel was excessive in the hard rock encountered.

Mucking was slow due to having to use a horse to pull the cars in and out of the mine, and switch the loads and empty cars by hand tramming. A Mancha Little Tramer would have reduced the cost of mine

COPY

haulage by at least 50%.

A summary of the actual work accomplished during the period under review is best obtained from the cost sheet which is made a part of this report. In addition another sheet is appended showing the cost per foot of the main items comprising the cost of drifting, crosscutting, raising and drilling four long holes from the No. 1 Raise. These data are best shown in tabulated form rather than described in the body of this report.

While no attempt is made to apportion all items of the cost distribution to each individual piece of work accomplished, sufficient detail is shown to make a reasonable deduction possible.

A statement showing the money spent on the project by Dr. Roy W. Key previous to the DMA contract participation is also appended, but this amount is included in the various items on the complete cost sheet.

As this is not a technical mining report on the property, but rather a summary of the work done and cost of same, further comment is not considered necessary.

In Conclusion: It is the writer's considered opinion that the project is uncompleted in that from the work accomplished no definite conclusion can be formed relative to the Shamrock ore body.

The conditions found in the work done underground do not coincide with the expectations predicated in the U.S. Bureau of Mines report by Mr. Popoff. Of course, this is not unusual in mining, especially so, considering the complex geological conditions extant on the property, and we still think that Mr. Popoff and the U.S. Bureau of Mines did excellent work.

Now that a better study of the geology underground can be made, further work is indicated to definitely find the extension, both horizontally and vertically, of the ore encountered in the several diamond drill holes. Also to follow by drifting the ore cut in Nos. 1, 2, and 3 Crosscuts east. This ore found in the crosscuts may prove to be the downward extension of the first ore encountered in U.S. Bureau of Mines drill hole No. 8A.

Several up-raises at different points in the south drift and crosscuts are recommended to follow this ore up along the fault planes on which it occurs.

While the ore so far encountered underground is of low grade and of doubtful commercial value at the present price of 11 cents per pound for zinc, the mine should not be condemned on this account, as most large ore bodies are low grade, and the time will come when this ore will be needed in our economy.

Our recent preliminary heavy media test on a general mine sample of the ore lends considerable encouragement for a cheap milling process

COPY

of heavy media followed by flotation for which the details, flow sheet and costs are now being worked out.

In this writer's opinion, based on a lifetime spent in operating mines, both large and small, over the country, when the Shamrock ore body is fully explored and developed a large tonnage of ore averaging at least 5% zinc will result, and profitable operation become possible. This prediction is based on close observation and study of the conditions extant on the property, and the type of sulphide ore found. The Wasa is not the only ore body in such a long mineralized zone.

Respectfully submitted,

Francis A. Hancock

Francis A. Hancock

Mine Water and air lines: Changing & Installation	347.75	.203
Mine Ventilation: Installation & Cost Vent tubing	827.16	.4848
Air Compressor & Power Unit: Operation & Maintenance	2,589.68	1.5175
Mine Haulage: Care of horse, clean tracks & ditch, level dump, etc.	2,652.06	1.554
Sharpening Tools: Drills, Bits, Picks, saws, axes, etc.	1,081.24	.6336
Transportation: Hauling Supplies, trips to mine, etc.	2,667.64	1.563
General Camp Maintenance: Watchman, Care of Buildings, cutting, wood for fuel, snow removal, etc.	1,805.05	1.058
Assaying	202.87	.119
General Supervision & Shift Bossing (75% amount charged)	3,108.17	1.82
Carried Forward	$63,468.20	$34.9115

STATEMENT SHOWING COST PER FOOT of the MAIN ITEMS CHARGED for Drifting, crosscutting, raising andDrilling Long Holes (continued):

ITEMS CHARGED TO WORK	TOTAL COST CHG'D	COST PER FOOT
Brought Forward	$63,468.20	$34.9115
Engineering: Surveying, mapping, etc. (75% amount charged)	1,170.25	.685
Office Expense (Mine Only) Labor and supplies	1,910.16	1.12
Total Cost per foot, Drifting, Crosscutting, Raising and Long Holes	$66,548.61	$36.7165
Less Equipment Rental & Depreciation		10.9340
NET COST		$25.7825

NOTE:
The Crosscuts were first driven without timber, then when the ground started to slough and cave, due to water in the ore zones, it was necessary to drill and blast to make room to stand timbers, This accounts for the higher cost of timbered crosscuts.

The cost of the No. 1 Raise is higher than estimated due to the fact that the Raise encountered diamond drill hole No. 8A from which a heavy flow of water gushed, making it extremely difficult to work there and slowed progress considerably.

General Supervision & Shift Bossing and Engineering are apportioned on the basis of 75% of total cost in the above because the other 25% rightly belongs to the outside or surface activity.

Progress Report No. 1

on

The Geologic Analysis

of

The Wasa-Shamrock

Ore Bodies

by

Albert R. Glockzin

COPY

INTRODUCTION

The chronological sequence of geologic work for the month of June was as follows:

Stage 1 - Initial reconnaissance of the Wasa-Shamrock property.

Stage 2 - Analysis of published literature on the district and of unpublished maps of the property drafted by the Bureau of Mines.

Stage 3 - Conferences in Spokane, Washington with representatives of the U. S. Bureau of Mines and the U. S. Geological Survey, and reading of the unpublished report by the Bureau of Mines on the Wasa-Shamrock and Forest Rose ore bodies.

Stage 4 - Additional reconnaissance of the Wasa-Shamrock and Forest Rose mine areas.

Stage 5 - Study of Kootenai stratigrahic sections in nonmetamorphosed areas near Drummond, Montana.

Stage 6 - Analysis of regional structures in the immediate areas north, south and west of the Wasa mine.

Stage 7 - Examination of all trenches on the Wasa-Shamrock ore bodies.

Stage 8 - Examination of the Upper, Middle and Lower Wasa mines without detailed mapping owing to lack of time.

Stage 9 - Analysis of all diamond drill core logs and assays.

Stage 10 - Trench No. 13 cleaned out, deepened and reexamined.

Stage 11 - Reexamination of the three Wasa mine levels.

Stage 12 - Conclusions and recommendations.

The base map for the enclosed Plate is the June 30, 1952 monthly progress map by Francis A. Hancock, Chief Engineer of the Western Montana Exploration and Development Co., Inc.

COPY

Summary of Recommendations

1. The existing underground workings of the Wasa Mine should be geologically mapped in detail on a scale of 20' per inch.

2. A 50' horizontal diamond drill hole bearing S70W is recommended from the end of the No. 1 cross cut west.

3. It is recommended that the south drift be continued to a point near coordinates 9000E, 8900N, a distance of about 280' and bearing S20E. From this point, according to the dictates of the geologic picture, 120' of east or west crosscutting or raising is to be recommended at the appropriate time.

4. It is recommended that about 500' of diamond drill hole be drilled is a series of short holes from the underground workings in the vicinity of Hole 8A and to test the theory of intersectional ores in the vicinity of the three east cross cuts. The sites, bearings, slopes and lengths of these holes is to be dictated by the current geologic picture after the completion of the extension of the south drift and the detailed geologic mapping.

5. It is recommended that detailed structural analysis be continued throughout the drifting 280' south.

6. It is <u>NOT</u> recommended that:

a. A raise be initiated from any site in the current underground workings.

b. Drifting be attempted on the East Gossan Fault Zone south from No. 3 cross cut east.

c. Drifting be attempted southward along the vertical shear of fracture zones in the middle of No. 3 cross cut east.

COPY

SUMMARY OF CONCLUSIONS

East Gossan Fault Zone

The two major surficial expressions of the Shamrock ore body are nearly parallel gossans trending approximately north-south. They are herein named the West Gossan (Fault Zone?) and the East Gossan Fault Zone. Their northward extension over the underground Wasa Mine workings is not clear. They may combine into a single gossan or, more probably, they may represent a cutting off of the West Gossan by the East Gossan Fault Zone.

The East Gossan Fault Zone can be currently observed in 9 places; 6 underground and 3 on the surface. The five best exposures are in the Lower Wasa Mine, in the main adit, in the southdrift and in the three cross cuts to the east (numbered 1-5 on the enclosed map). It is also exposed in the Middle Wasa Mine at map point 7. On the surface it outcrops at point 6, 8 and 9 (Trench No. 13). In Trench No. 14 the rocks are so highly weathered and structures so obliterated that the relationships are unclear.

At the surface it strikes about N23W and dips about 55 to 62NE. Underground the strike is about the same but the dips are less, from about 30 to 50 NE. Thus, the fault zone is concave in dip to the northeast. On the enclosed map the solid red lines represent the 6020, 6100, 6120, 6140 and 6200 contours on the East Gossan Fault Zone using the average dip of 47 NE. This removes the curvature but with additional details this curvature will be analyzed and applied to the structural intersections involved.

In Trench No. 13 the West Gossan strikes N5W and dips about 60 E. At the current stage of geologic analysis it is thought that this gossan is cut

COPY

by the East Gossan Fault Zone at a point about 120' north of Trench No. 13. The line of intersection between the two structures is shown on the map in blue (minus the curvature), bears N16E and plunges 34 degrees.

Hole 8A

Hole 8A bearing west and sloping 45 degrees (replotted on the base map) cut three ore zones at the map positions and depths shown. The lower two are the richer and seem to be equivalent to the West Gossan at the surface in Trench No. 14. The upper ore zone is thought to be the East Gossan Fault Zone. This conclusion is based on the projection of the outcrops in Trench 14 down to the ore zones in Hole 8A in addition to the vast difference in core recovery. The upper ore zone cored less than 45% and as low as 25%. The lower two ore zones cored between 97% and 100%.

If the strike and dip of the lower two ore zones are approximately N5W60E and if they continue northward, they should intersect the East Gossan Fault Zone as indicated, i.e., with a bearing and plunge similar to the intersection of the two gossans. The 6020' contours of each of these two lower ore bodies in Hole 8A are plotted in blue and extended northward to the points where they should have been intersected in the No. 2 and No. 3 cross cuts east. These ore zones were <u>not</u> encountered in the cross cuts and it must be concluded that:

a. Their strike and dip are different from that indicated at the surface in Trench No. 14 and their projection to Hole 8A -

b. Or there is some unknown structural disturbance between the No. 3 cross cut east and Hole 8A. -

The writer believes that the latter is true and that structurally it is mandatory for the south drift to be continued about 280' and turned to

COPY

S20E in order to more closely approach the known ores in Hole 8A and to determine the nature of the structural discrepancy. This information, when combined with the detailed structural analysis and additional knowledge of the East Gossan Fault Zone, should solve the major structural problem of the Wasa-Shamrock ore bodies.

HYPOTHESIS REGARDING THE IMPORTANCE OF THE WEST AND THE EAST GOSSANS

At this early stage in the structural analysis it is apparent that the ores of the Lower and Middle Wasa which have already been mined are all located in the hanging wall block of the East Gossan Fault Zone. These ores strike nearly north-south and dip steeply to the east. It is thought that the East Gossan Fault Zone may be the feeding channel for the mineralizers and that the ores were emplaced in fracture zones in the hanging wall block. This means that southward they abut against the fault and are not continuous into the foot wall block. Of course, there may have been considerable movement along the fault following mineralization.

The nature of the movement along the East Gossan Fault Zone is not yet prooved. There is some evidence for strike slip, the northeast block and hanging wall moving southeast; but there is also some evidence that the fault is normal. It may even be reverse.

The West Gossan may be a similar type fault zone and feeding channel. It can only be observed in Trenches 13 and 14. Its details are unknown, however, the lower two ore zones in Hole 8A may represent nearly vertical ore bodies in the hanging wall block of the West Gossan Fault Zone.

COPY

These concepts may be best tested by drifting about 280' S20E with subsequent crosscutting and/or raising together with a few short underground diamond drill holes. At this stage in the exploration the details of possible structural intersection and their associated ore shoots may be well enough understood to pinpoint some short drill holes into such intersections for the final test.

Footwall in Trench No. 13

Trench No. 13 has been considerably deepened and it has been observed that the footwall of the West Gossan dips 48 E at the top of the trench and 62 E at the bottom. Analysis of bedding plane (?) faulting indicates that the tight isoclinal Wasa-Shamrock anticline is overturned to the west and that the footwall of the West Gossan is on the west limb of the anticline. Thus, the footwall o at depth should become more nearly vertical and eventually dip to the west, especially since the West Gossan ores have not been encountered in any of the crosscuts. This, of course, argues against the concept that the West Gossan is a cross-cutting fault zone at Trench No. 13, but it may be at Trench No. 14.

The amount of this possible curvature is unknown but it should not be much throughout the mere 180' difference in elevation between Trench No. 13 and the No. 1 cross cut west. Therefore, it is recommended that a 50' horizontal diamond drill hole bearing S70W be commenced from the end of the west cross cut in order to explore for the ore against the footwall of the West Gossan at the 6020' level.

The significance of the thrust fault near the east end of Trench No. 13 is not clear. The thrusting has been from east to west and may be the structure which accounts for the overturning of the anticline. All other known thrusts in the region are from west to east and the presence of this back thrust is currently unaccounted for.

POSSIBLE VERTICAL ORE BODIES TO BE

ENCOUNTERED IN THE SOUTH DRIFT.

COPY

It has been previously mentioned that there is a possibility the ores in Hole 8A may be vertical. If this is true they would be encountered at 50' and 125' S20E along extension of the south drift from its present terminus.

In the middle of cross cut No. 3 east are two vertical, N10E, shear or fracture zones, completely unmineralized. These may represent a fracture system in which ores are emplaced to the south near the intersection of this structure with the West Gossan. If their attitudes remain constant this structure should be encountered at 185' S20E along the south drift extended.

COPY

ADDENDUM A

August 10, 1952

EXTENSION OF THE SOUTH DRIFT

The south drift has been extended about 185' from its March 31st face. Three N10E nearly vertical faults were encountered at 108', 137' and 164'. These zones are probably the same as the N10E vertical zones in the middle of the No. 3 crosscut east. The significance of these fault zones is not as yet clear.

The two lower ore zones known to exist in Hole 8A have not been encountered in the S20E extension of the south drift. Therefore, the following conclusions are in order:

1. If the strike of the lower two ore zones in Hole 8A is N5W, then their dip is not vertical but some value less than 75E.

2. If their dip is vertical, then their strike is more easterly than N15E.

3. If the strike is N5W and the dip 60E they will be encountered as shown on the map.

4. If the strike is N10E and the dip 60E the lowermost ore zone of Hole 8A should be cut at about 265' from the March 31st face.

5. If the strike is N5W and the dip nearly vertical, then the structures and mineralization in Hole 8A do not extend very far north.

The exposures in the extended south drift have not yet revealed the nature of the structural discrepancy previously discussed. With the known ores of Hole 8A some 95' beyond the present face it is still predicted that this discrepancy will be resolved.

Contract Idm-E30

* * * *

INTRODUCTION

This report describes a lead-zinc exploration project conducted at the Wasa mine, Dunkleberg mining district, Granite County, Montana. The project was conducted under the terms of exploration project contract Idm-E30 by Key and Durand, a limited partnership, and their successor in interest to the property, the Western Montana Exploration and Development Company, with Defense Minerals Exploration Administration assistance.

The Dunkleberg mining district has been described in reports by Pardee 1/, Full 2/, and Popoff 3/. No specific reference will be made in the body of this report to these previous reports. However, the authors wish to acknowledge that they have borrowed freely of information contained in these previous reports and in particular from portions of Popoff's report which deals with Bureau of Mines' exploration at the Wasa mine.

Summary

The project was undertaken to explore the "Wasa-Shamrock ore zone" south of the principal Wasa workings. Trenching and diamond drilling by the Bureau of Mines prior to the contract suggested the presence of one and possibly more zinc ore bodies along this zone, 250 to 850 feet south of these workings. The ore showings uncovered by the Bureau of Mines were reported to compare favorably with the outcrop of the original Wasa ore body from which 50,000 to 60,000 tons of 4.9 percent zinc and 0.3 percent lead ore were mined during World War II. By analogy, it was hoped that a similar ore body or bodies could be found by underground exploration south of the principal Wasa workings.

1/ Pardee, J. T., The Dunkleberg Mining District, Granite County, Montana: USGS Bull. 660g, 1918, pp. 241-247.

2/ Full, R. P., Memorandum on Forest Rose Syndicate, Granite County, Montana: Confidential report for USGS, 1943.

3/ Popoff, C. C., Lead-zinc deposits of the Dunkleberg district, Granite County, Montana: USBM R.I. 5014, 1953.

Under the DMEA program, the "Wasa-Shamrock ore zone" was explored from the Wasa No. 1 level for a distance 850 feet south of the principal workings. Drifting, crosscutting, and raising within the limits of this ore zone disclosed minor amounts of zinc but no commercial ore. This work more than adequately tested the ore zone 200 to 300 feet below the most favorable surface showings and strongly indicates that the structure does not carry commercial concentrations of ore minerals at any great depth below the most favorable surface showings.

Final audit of contract expenditures has been made and accepted by the DMEA. Of the total amount of $85,850 provided for in the contract, the sum of $83,424.13 was accepted as approved expenditures, after crediting sales of equipment, buildings, and supplies. The Government's share of the cost of the project was 50 percent of the total approved expenditures or $41,712.07.

Recommendation

Upon the basis of information previously submitted, the operator was informed by letter from the Administrator's office on September 2, 1953, that the Government does not intend to certify the project as a discovery or development.

Government participation in further exploration at the Wasa mine is not warranted.

LOCATION AND ACCESSIBILITY

The Wasa mine is in the Dunkleberg mining district in the Flint Creek Range of the northern Rocky Mountains; it is west of the Continental Divide and south of the Clark Fork River. The Wasa group of mining claims are in the S½ of sec. 27 and the N½ of sec. 34, T. 9 N., R. 12 W., Montana Principle Meridian, in the northeastern corner of Granite County, Montana. The Wasa mine is about 10 miles southeast of Hall, Montana, a ranching village of about 150 inhabitants on Highway No. 10A near the northern end of the Flint Creek Valley.

The mine is reached by following Highway No. 10A 2 miles south from Hall, and then proceeding eastward on a dirt access road up Douglas Creek for a distance of 8 miles. A branch line of the Northern Pacific Railway runs through Hall, where rail loading facilities are available.

The Dunkleberg district is one of relatively strong relief; most of the mines and prospects are on an elongated, northerly trending upland, known as Dunkleberg Ridge. Altitudes within the area

range from 5,000 to 8,000 feet. Ridge slopes are heavily wooded, with the lower summits being more rocky. The climate of the region is temperate, with wide daily and seasonal temperature variations. Summer and fall are the most pleasant seasons. Winter temperatures of 20 degrees below zero are not uncommon. The first snow usually falls in September but remains on the ground only at higher altitudes. Later snowfalls cover the entire district from November to May. The Wasa mine can be made accessible throughout the winter season by occasional snow removal from the mine access road.

PROPERTY

The Wasa mining property consists of 26 quartz lode, mill site, and tunnel site claims. Nineteen of these claims are owned by the Western Montana Exploration and Development Company and are covered by the exploration project contract. These claims were owned by Key and Durand, a limited partnership, the original operator under the contract. Key and Durand assigned their interest in the property and the contract to the Western Montana Exploration and Development Company in the fall of 1951. The Government consented to the assignment of the contract June 18, 1952. The remaining seven claims are held by the Western Montana Exploration and Development Company under the terms of a lease and option agreement with the estate of James L. Leonard. This agreement was entered into in March 1952, nine months after the contract was signed. The agreement not only provided the company with additional ground but assured them of definite rights in certain claims covered in the contract but which were found to be in conflict with claims owned by the Leonard estate. When the contract was negotiated, the Government was not fully aware of the conflict.

Few of the early-day workings at the Wasa mine are now accessible, but most of the recent workings are open for inspection. The mine workings consist of several adits driven east from the northeast side of Douglas Creek, viz., Wasa No. 3 (6,140-foot altitude), Wasa No. 2 (6,100-foot altitude), Zimmer Jack (6,110-foot altitude), and lower Wasa or No. 1 adit (6,020-foot altitude). The combined length of these adits and drifts exceeds 2,500 feet. Other Wasa workings also include more than 1,000 feet of crosscutting and approximately 200 feet of raising. Also a part of the Wasa holdings is the 740-foot Kirkendal adit (6,322-foot altitude) and the 400-foot Keokl adit (6,290-foot altitude).

Surface installations at the property include a combination compressor, blacksmith and warehouse building, a cookhouse, and a four-man capacity bunkhouse.

All underground exploration under the DMEA contract was performed from Wasa No. 1 adit. Active use has not been made of the adit since World War II, and it required 630 feet of rehabilitation at a cost of $2,218.14 at the start of the DMEA program in 1951. Ground conditions are good at the Wasa property and timbering is only necessary in faulted areas. Modified shrinkage stoping with little or no timber was used when the property was last in production. Access to most workings could be gained at a modest expense for rehabilitation and cleanup.

Ventilation of mine workings is provided by a vent fan and tubing. Drainage is by ditches alongside the track in the crosscuts and drifts. Seepage from surface introduces much of the water found in the mine workings.

History and Past Production

The Wasa mine was discovered in 1910. During World War I it was extensively explored by underground openings and diamond drilling; however, no production resulted from this work. After this brief period of activity, the property lay dormant until World War II when it was purchased by the Forest Rose Syndicate of which Mr. James L. Leonard was the principal owner. The Syndicate operated the mine in conjunction with the nearby Forest Rose mine. Ore from both properties was treated in a 100-ton flotation mill at the Forest Rose mine, a mile distant from the Wasa mine. Total production from the Forest Rose Syndicate's operation between 1941 and 1946 is reported at 112,749 tons of ore which represents 97.3 percent of the total recorded crude ore production from the district. Of the total production, it is estimated that about 50 percent of it came from the Wasa mine. This is slightly lower than the figure, "about 80,000 tons", quoted in exhibit A of the contract as having come from the Wasa ore body, but it is believed to be more realistic. The ore from the Wasa is reported to have averaged 4.9 percent zinc and 0.3 percent lead. The Syndicate closed operations almost immediately after removal of the premium price following the war and little ore has been produced in the district since.

From 1946 to 1949 the Bureau of Mines conducted a trenching, diamond drilling, sampling, and mapping program in the district. The DMEA program was undertaken to explore the "Wasa-Shamrock ore zone" south of the Wasa workings which Bureau of Mines trenching and drilling indicated merited further work.

GEOLOGY

The Dunkleberg district is in an area underlain principally by sandstones, shales, and limestones. These rocks vary in age from Pennsylvanian to Upper Cretaceous and are represented by the Quadrant (Pennsylvanian), Phosphoria (Permian), Ellis (Jurassic), Kootenai (Lower Cretaceous), and Colorado (Upper Cretaceous) formations. Gabbro and diorite sills have intruded some of the sedimentary rocks. Both the sedimentary rocks and sills have been tightly folded into a series of northward plunging anticlines and synclines.

The principal base and precious metal deposits of the area are those which constitute the Dunkleberg district. These deposits occur chiefly within sandstones, shales, and limestones of the Kootenai formation on the flanks and crest of an anticlinal structure known as the Dunkleberg anticline. Both vein and limestone replacement deposits are found within the district. Sphalerite and silver-bearing galena are the principal ore minerals; however, chalcopyrite is present in minor amounts in some of the ores.

The Wasa mine is in the southern part of the district near the axis of the Dunkleberg anticline. Rocks exposed in the mine workings are a part of the lower Kootenai formation. It is difficult to distinguish the original character of the rocks because the sediments have been metamorphosed and in places silicified to form a hornfelsic rock. Within the immediate mine area appreciable amounts of disseminated pyrite occur throughout the metamorphosed sediments and weathering of this pyrite has further obscured the original character of the rocks.

The principal structure at the mine is the Wasa-Shamrock fault zone, which was explored under the contract. This fault strikes N. 25° W. and dips 19° to 68° northeast. The principal zone of shearing and brecciation varies in width from about 20 to 60 feet. Displacement along this fault is not known, but presumably it is large. Similar faults in the area are known to have normal displacements of as much as 1,000 feet. This fault zone has been traced only a short distance north of the mine. However, it can be followed in Bureau of Mines trenches for about 2,500 feet south of the mine.

The fault contains some minor lenses of quartz and sulfides. The principal sulfide minerals are pyrite, pyrrhotite, sphalerite, and galena. However, for the most part, the fault itself is but weakly mineralized. This is discussed in detail in sections of this report dealing with Bureau of Mines exploration previous to the DMEA exploration program, structure exposed by the DMEA exploration program, and work completed by the operator after the DMEA exploration program.

The Wasa ore body from which all past production from the property has come is in the immediate hanging wall area of the Wasa-Shamrock fault. Mineralization appears to be controlled by numerous small faults and fractures in the hanging wall of the Wasa-Shamrock fault. There is a suggestion that the primary control of the body may be exercised by the intersection of several north striking, near vertical east-dipping faults and fractures with the main Wasa-Shamrock fault. Several Bureau of Mines diamond drill holes have cut ore minerals in this structure below the Wasa No. 1 level. These holes encountered ore minerals at depth varying from 40 to 200 feet below the Wasa No. 1 level. Ore minerals encountered to a depth of 70 feet can definitely be correlated with the Wasa ore body; however, it is difficult to correlate the deeper ore cut with the principal Wasa ore body without additional information. Because of the marginal grade of the Wasa ore body (4.9 percent zinc and 0.3 percent lead) and the fact that ore would have to be hoisted, this body would be of interest only during periods of unusally high prices for zinc.

It would be well to note that this concept of the Wasa ore body is different than presented at the start of contract work. It was believed at that time that the Wasa ore body in the hanging wall of the Wasa-Shamrock fault was formed by the replacement of several thin favorable limestone beds which were tightly folded and broken along the axis of the Dunkleberg anticline.

Bureau of Mines Exploration Previous to DMEA Program

The Bureau of Mines conducted an exploration project at the property several years prior to the DMEA program. The DMEA project was undertaken to explore an area south of the Wasa workings which Bureau of Mines trenching and diamond drilling indicated merited further work.

Seven trenches across the "Wasa-Shamrock ore zone" traced the zone approximately 2,500 feet south of the principal Wasa workings. Samples taken in these trenches showed the zone to carry small amounts of zinc, lead, silver, and copper. The most promising showings were cut in trench 13 approximately 600 feet south of the Wasa No. 1 adit and 400 feet south of Wasa No. 3 adit workings. Two south-trending gossan zones in the trench contained significant amounts of zinc. Samples across a 10-foot portion of the east gossan outcrop averaged 4.75 percent zinc, whereas samples across the entire 22 feet of the east gossan outcrop averaged 2.70 percent zinc. Samples across 16 feet of the west gossan outcrop averaged 1.88 percent zinc. It is now apparent that these gossans are a part of the principal shear of the Wasa-Shamrock fault. However, when contract work started, they were thought to represent a replacement ore body in thin tightly folded limestone beds along the axis of the Dunkleberg anticline and similar to the Wasa ore body.

Significant amounts of zinc were also found in Bureau of Mines DDH 8A, 300 feet south of the trench. This hole was drilled from the surface on bearing West, inclination 45 degrees to a depth of 430 feet. See Annex II of this report for the Bureau of Mines log of this hole and plate 3 for a geologic cross section through the hole. The most favorable assays from the hole were obtained from the following portions of the core: 135 to 142.2 feet, 2.62 percent zinc; 207.3 to 213.4 feet, 6.17 percent zinc; and 238.8 to 243.8, 3.1 percent zinc. Small amounts of lead, copper, and silver were also present in some portion of the core (see log for details).

THE PROJECT

The project was undertaken to explore the "Wasa-Shamrock ore zone" south of the principal Wasa workings in an area where Bureau of Mines trenching and diamond drilling indicated the possibility of finding ore bodies similar to the Wasa ore body.

The original contract provided $66,500 for extension of the Wasa No. 1 adit level workings into this area. Structural conditions encountered underground were somewhat different than indicated by the Bureau of Mines trenching and diamond drilling and it was, therefore, necessary to interpret the contract rather loosely in order to accomplish the contract objectives. Whereas, the contract provided for 800 feet of drifting on the main structure to intersect the Shamrock ore body (ore exposed in trench 13) and explore the area south of it, as well as an additional 800 feet of crosscutting and drifting for exploration of the Shamrock and other possible ore bodies, it was necessary to interpret this as 300 feet of drifting and lateral work within the "ore zone" and an additional 800 feet of drifting, crosscutting, and lateral work to further explore the "ore zone." In addition, the contract provided funds for rehabilitation of 900 feet of the Wasa No. 1 adit level to allow access to the exploration area, 1,000 feet of diamond drilling for exploration ahead of crosscutting and drifting, and 165 hours of bulldozing for surface exploration. Also, 250 hours of bulldozing was allowed for road cleaning (snow removal). Separate funds were also allowed for supervision and engineering, sampling and assaying, and timbering of the underground workings.

Eight amendments were made to the contract. Amendments No. 1 and No. 5 permitted the hiring of a bookkeeper and geologist for the project. Amendments No. 2, 3, 4, and 6 were made primarily to facilitate work to meet changing operating conditions. Amendment No. 2 permitted the rental of a portable compressor, Amendment No. 3 permitted relocation of a portion of the access road which was subject to heavy drifting snow. It also made the operator responsible for snow removal

and deleted 250 hours of bulldozing in the contract for this purpose. Amendment No. 4 permitted several changes in minor items of work in the contract, construction of a mine building, boarding house and miscellaneous mine fixtures, purchase of four mine cars, and adds a superintendent-engineer to the schedule of labor. Items of work changed were: The amount of timbering provided for in the contract was reduced from 320 to 150 feet, the amount of surface exploration dozing was reduced from 165 hours to 10 hours, and the amount of diamond drilling reduced from 1,000 to 700 feet. Amendment No. 6 extended the time limit of the contract from 12 to 13 months.

Amendment No. 7 was made to provide an additional $19,350 to the contract in order to complete work authorized when original contract funds became exhausted. The amendment specifically provided for advance of the south drift within the "ore zone" 280 feet south to the area of Bureau of Mines DDH 8A; 120 feet of crosscutting east and west in this area; and for 500 feet of diamond drilling in the vicinity of hole 8A. Also, additional funds were allowed for the employment of a part-time consulting geologist, and time to complete the work was extended to 18 months. Amendment No. 8 was made to permit 96 feet of raising to cut ore exposed in hole 8A when it was found that the operator's diamond drilling equipment was inadequate and the position of the workings were such as to not allow the establishment of suitable drill sites to adequately test the area.

Except for a minor amount of dozer trenching in the vicinity of Bureau of Mines trench No. 13, actual exploration was confined to exploration of the "Wasa-Shamrock ore zone" on and from the Wasa No. 1 level. The zone was explored for a distance 350 feet south of the principal Wasa workings. This work entailed the driving of 927 feet of drift, 666.5 feet of crosscuts, and 110 feet (84 feet completed under contract) of raise.

The contract was signed June 28, 1951, and work commenced about July 1, 1951. Work was completed in December 1952.

Discussion of Structure Exposed by the Exploration Program

The geology of the DMEA workings on the Wasa No. 1 adit level is shown on plate 1 of this report.

The Wasa-Shamrock fault strikes N. 25° W. and dips 19° - 68° NE in the Wasa No. 1 adit level workings. The width of the fault appears to be about 25 feet. It appears that this structure is the "ore"-bearing structure exposed in Bureau of Mines trenches No. 13 and 14. It can also be correlated with a very low grade ore-bearing mineral zone in Bureau of Mines DDH 8A. However, the better zinc assays from this hole are in the footwall of the Wasa-Shamrock fault.

The Wasa-Shamrock fault is exposed in the main Wasa No. 1 adit crosscut 595 feet from the portal. Where exposed, it does contain traces of zinc, lead, and copper minerals. However, the significance of this fact appears to have been overlooked when contract work was planned because of the more imposing Wasa ore body in the hanging wall of the fault. It should be recalled that the Wasa ore body strikes north, dips steeply east, and plunges north.

The Wasa-Shamrock fault is well exposed at four places in the DMEA workings. It was first cut in the south lateral 137 feet south of the main adit crosscut (see plate 1). The lateral crosses the shear from hanging to footwall at an oblique angle and is within the shear for about 215 feet. Several small lenses of quartz, pyrite, and sphalerite were exposed in the shear in this section of the lateral. None of these lenses are of sufficient size or grade to be of any economic importance. Attempts were made to have the operator take car samples through this section of the lateral. However, the operator was not interested in obtaining this information and reported the zone was too low grade to be of any interest. It was also inferred that part of the operator's reluctance to take samples could be attributed to the fact that there was a possible cloud to his title to this particular part of the property which was not removed until he leased ~~out~~ the conflicting claims.

Crosscuts were driven from the south lateral at points 390 feet (No. 1 crosscut), 490 feet (No. 2 crosscut), and 640 feet (No. 3 crosscut) south of the main adit crosscut to test the fault. Several small quartz-sulfide lenses were also exposed in the fault in the crosscuts but no commercial ore, although the operator's samples showed several bands approaching or even above ore grade. The crosscuts were sampled by DMEA representatives and this data is shown on plate 2 of this report. Of thirty-seven samples cut in the crosscuts only three assayed better than 4 percent zinc, i.e., 4.1, 4.1, and 4.2 percent. In the No. 1 and No. 2 crosscuts samples were taken across both the north and south walls of the crosscut. Samples from the No. 1 crosscut across an apparent width of 48 feet averaged 1.47 percent zinc and 0.03 percent lead. Samples from the No. 2 crosscut across an apparent width of 35.5 feet average 0.80 percent zinc and 0.03 percent lead. One sample 5 feet across the only lens of sulfide exposed in the No. 3 crosscut assayed 0.9 percent zinc and 0.06 percent lead. Some of the samples taken also contained a few tenths of an ounce of silver.

The operator was advised by DMEA personnel on several occasions that it would be well to follow the hanging wall of the fault and to test the fault and the footwall area by an occasional crosscut. It is believed that such a plan would have better tested the hanging wall area of the ore zone, which is the area in which the Wasa ore body occurs. However, this advice was not followed as the operator

believed that it would be better to drive the lateral in the footwall and crosscut to test the hanging wall. He hoped by this work to find a large ore body which he believed was indicated in the footwall of the Wasa-Shamrock fault by the assays from Bureau of Mines hole 8A.

The DMEA raise to test the indicated footwall ore in Bureau of Mines DDH 8A intersected the hole 100 feet above the Wasa No. 3 adit sill. Fortunately, it cut the hole at the best ore intercept (see plate 3). Ore encountered in the raise was nothing more than two small lenticular shaped pods. These are shown in plan and section on plate 3. It will be noted that the drill hole cut the bodies at a very oblique angle, thus the width as noted in the drill hole is much wider than the true width observed in the raise. Samples cut in the west wall of the raise from 89 to 93 feet assayed no zinc and trace lead; from 93 to 98 feet 0.25 percent zinc and trace lead; and from 98 to 104 feet, 5.2 percent zinc and trace lead.

A small amount of surface trenching was completed in the vicinity of Bureau of Mines trenches 13 and 14 during the project. The two trenches were cleaned and the area north of trench 13 was stripped for about 100 feet. This work better exposed the structure but added little to the knowledge of the deposit.

Work Completed After the DMEA Project

During the early part of the summer of 1953, the Western Montana Exploration and Development Company carried on a modest company exploration program. The program consisted of deepening dozer trench 13 and the area immediately to the north and also trench 14. The two gossans in trench 13 were better exposed and could be traced for about 100 feet to the north of the trench. A sample cut across 12.8 feet of the east or hanging wall gossan assayed 4.6 percent zinc. A sample cut across 11 feet of the west gossan, or footwall gossan, assayed 3.2 percent zinc. Oxidation was prevalent in the deepened trenches but sulfides were present to a much greater degree than before the trenches were deepened.

At the present time the operator is giving some consideration to a plan to open pit this area. Undoubtedly, the trenching has uncovered a small tonnage of 3 to 4 percent zinc material. However, this is a mixture of oxide and sulfide which would be difficult to mill. It should be pointed out that the DMEA workings under this favorable

outcrop show the zone to be low grade at a depth of only 200 feet. The operator believes, however, that this ore correlates with the main Wasa ore body on rake. It should be pointed out that this ore is confined to the principal shear of the Wasa-Shamrock fault, whereas the Wasa ore body is in the hanging wall of the fault. Furthermore, in order to connect this showing with the Wasa ore body, one would have to assume a very flat rake to the ore body which is not indicated in the Wasa workings. The north end of the gossan exposed in the trench is about 300 feet south and only 50 to 60 feet higher than the upper workings on the Wasa ore body. Upon the basis of present knowledge of the deposit, this does not appear to be a valid correlation.

Summary of Factual Data

Work completed under DMEA contract Idm-E30 included the following:

Rehabilitation and cleanup of 630 feet of the Wasa No. 1 adit.

Driving of 927 feet of drift and lateral from Wasa No. 1 adit.

Driving of 666.5 feet of crosscuts and slabbing for turns from Wasa No. 1 adit.

Timbering of drifts and crosscuts (76 sets, 380 feet) in Wasa No. 1 adit.

Driving 110 feet of stull raise from Wasa No. 1 level (84.5 feet completed under the contract).

Construction of 1-5/8 miles of mine access road.

Surface exploration consisting of 1-1/3 months of surface geologic study and a minor amount of bulldozing.

Sample analyses in the amount of $40.25.

New buildings and improvements in the amount of $2,559.80.

Factual Data

In its final amended form the total amount of contract Idm-E30 was $85,850. The sum of $86,905.79 was expended on the exploration project. Equipment salvage amounted to $3,481.66, leaving an expended total of $83,424.13. The Government's share of the cost was on a 50 percent basis, or $41,712.07.

Most of the work performed under the DMEA contract was on an actual cost basis. Consequently, the conversion of project costs to the unit basis represents an approximation of expenses chargeable to individual items. Existing records do not permit an exact distribution of costs on the unit basis. However, the tabulation of unit costs compiled and entered in the annex of this report is considered to present a fairly accurate distribution.

A review of the costs chargeable to the various phases of the program reveals the work could have been performed for considerably less money. The operation was carried out in as efficient a manner as circumstances would permit. The chief contributing factor to the high costs was the operator's inability to provide his share of the expenses when needed. This resulted in an intermittent one-shift operation with the operator often finding it difficult to meet current expenses. Equipment rental costs and other fixed items of expense consequently contributed an excessive proportion of the operating costs. A steady two- or three-shift operation would have resulted in very satisfactory project costs.

Equipment and supplies purchased under the contract have been properly disposed of, and the Government has been reimbursed for its share of the depreciated value of the pertinent items.

Tabulation of Purchased Equipment and Supplies

Item	Original Purchase Price	Salvage Value	DMEA Equity
4 mine cars	$ 1,300.00	$ 942.00	$ 471.00
Miscellaneous buildings	2,559.80	2,267.28	1,133.64
1,000 lbs. dynamite	221.00	221.00	110.50
3,000 feet of fuse	36.90	36.90	18.45
800 No. 6K blasting caps	14.48	14.48	7.24
Total	$ 4,132.18	$ 3,481.66	$ 1,740.83

Conclusion

Work under the DMEA program has tested the "Wasa-Shamrock ore zone" over a length of 850 feet, 200 to 300 feet below the

most favorable surface showings. It has disclosed minor zinc mineralization but no commercial ore. The work also showed that the most favorable ore intercepts in Bureau of Mines DDH 8A were nothing more than small pods or lenses of sulfide minerals.

It is now evident that it would have been best to have confined the DMEA work more to the hanging wall area of the Wasa-Shamrock fault, as that is the area in which the Wasa ore body occurs. When this suggestion was made to the operator during the life of the contract, he did not believe it worthwhile. He believed that the best ore intercepts in Bureau of Mines DDH 8A indicated an ore body in the footwall of the fault. At that time, however, there was insufficient evidence to dispute this contention and the operator was allowed to continue work toward the target indicated in hole 8A, after early work showed the ore in trench 13 did not extend to depth.

It is conceivable that all of the Wasa-Shamrock fault zone was not intersected by the DMEA crosscuts or that a parallel shear zone may exist east of the Wasa-Shamrock fault zone, along which ore bodies similar to the Wasa could be found. It should be pointed out, however, that the DMEA crosscuts driven to explore the immediate hanging wall area of the Wasa-Shamrock fault for ore bodies similar to the Wasa ore body are believed adequate to test the immediate hanging wall area, but it would be possible to test the hanging wall area further to the east by diamond drilling from the DMEA workings. Such exploration would be more or less of a wild cat nature as there are no definite ore targets involved, and in our opinion the chances of finding any ore body of significance are considered too remote to justify Government participation.

The Bureau of Mines diamond drilling to test the main Wasa ore body at depth has shown it to continue to a depth of 70 feet and possibly to a depth of 200 feet below the Wasa No. 1 adit level. Undoubtedly, additional exploration could be undertaken to further test this body at depth by mine openings. However, the marginal grade of the body (4.9 percent zinc and 0.3 percent lead) and the fact that ore would have to be hoisted makes this body of interest only during periods of unusually high prices for zinc. For this reason, exploration of the Wasa ore body at depth at this time is not considered warranted.
