Memorandum

To: The File

From: Assistant Chief, Office of Minerals Exploration

Subject: DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Mr. William Hasler, OME Field Officer, Region III, reported to me by phone yesterday that a representative of the Molybdenum Corporation of America recently stated that reserves at the Questa property were on the order of 3 billion tons of ore containing an average of 3 pounds molybdenum per ton (0.25% MoS_2) or 9 billion pounds of contained molybdenum.

The company's estimate of reserves as of June 1960, which was published in Mining Engineering, January 1961, totalled 260 million tons of ore containing an average of 3 pounds molybdenum per ton (0.25% MoS_2) or 760 million pounds of contained molybdenum. This was essentially the same estimate reported in the Operator's final report on the subject contract.

The new estimate represents about a 4-fold increase in molybdenum reserves, and no doubt results from extensive exploration and development work associated with bringing the property into full scale production.

Contract Idm-E1094

Gentlemen:

Thank you for your letter of August 3, 1966, transmitting your check in the amount of $148,376.76 completing the repayment of The Government's contribution of $200,339.57 to the costs of exploration under the subject contract.

We congratulate you on the success you have achieved in bringing the project at the Questa mine into production.

Sincerely yours,

FRANK E. JOHNSON

Dear Mr. Hasler:

Enclosed is our check in the amount of $148,376.76, this being the sixth and final repayment of royalty under the DMEA loan, Contract Idm-E-1094.- 4568

A statement of the royalty calculation is also enclosed, based on second quarter processing of concentrates from the Questa Mine. As you will note, the royalty calculation exceeds the loan balance.

Very truly yours,

George A. Matthews
Assistant Controller

Dear Mr. Hasler:

Enclosed herewith is our check in the amount of $50,782.86, this being the fifth repayment of royalty under the DMEA loan, Contract Idm - E - 1094.

A statement of the calculations of royalty is also enclosed. The calculations were based on first quarter direct sales and processing of concentrates from the Questa Mine.

It is expected that next quarter royalties will repay the DMEA loan in full.

Very truly yours,

George A. Matthews

if adverse to a claim holder. "These cases involve basic legal and factual issues fundamental to the validity of many other oil-shale locations," Udall said. "Resolution of the issues presented in these cases could provide the basis for action on other claims." The claims have been 1920 pending more than 44 years--since before the Mineral Leasing Act of ~~1929~~ made oil shale subject to mineral leasing rather than location under the mining laws. (Denver Post, 9/10/64, and Rocky Mountain News, 9/11/64)

Vanadium. - Union Carbide Corp. has announced plans to reopen its Rifle vanadium mine, 10 miles north of Rifle, Colo., late this year or early in 1965. The mine has been worked intermittently since Union Carbide acquired the property in 1926 through acquisition of Vanadium Corp. of Colorado. When operations are resumed, ore will be hauled to Carbide's nearby uranium-vanadium mill at Rifle. (Metal Mining & Processing, 9/64)

Molybdenum. - Molybdenum Corp. of America announced arrangements whereby it will raise $27.5 million required for development of mining properties near Questa, N. Mex. Dow Jones News Service reported that Bankers Trust of New York and Mellon National Bank and Trust Co. of Pittsburg, Pa., have agreed to provide $20 million on a revolving loan that will convert to a 5-year term loan in 1966. The financial wire said the company also plans to issue rights to 125,000 shares of common stock and subordinate debentures to raise $12.5 million, part of which will go to capitalize the Questa operation. (Albuquerque Journal, 9/16/64)

Dale Bellamah Land Co., Inc., will develop a major residential subdivision in Questa, N. Mex. The subdivision will meet the demand for housing created by the activities of the Molybdenum Corp. of America, which has let a contract for construction of a $25-million mine and mill installation east of Questa. In 6 or 7 years, when development is complete, Questa is expected to have a population of about 3,000 persons. About 1,200 persons now are living in Questa. American Moly now employs about 300 persons in activities connected with a pilot mine and mill. Mine employment is expected to reach at least 450 persons when large scale mining and milling begin some time next summer. Mine and mill construction will involve a work force of about 500. In addition, the new basic-industry population will create opportunities for hundreds more in service enterprises. American Moly is expected to move about 12 million tons of material annually at its Questa mine. The mill will refine 5 or 6 pounds of 80-percent-pure molybdenum from each ton of raw ore. The concentrate will go to a Pennsylvania plant for further refining. Current expectations are that the Questa mine will remain in operation for at least 40 or 50 years. Molybdenum is a temperature-resistant alloying metal used in steel fabrication and in missile applications. (Albuquerque Journal, 8/19/64)

Copper. - Mr. Orrin F. Marvin of Phoenix, Ariz., has announced development of a new process to recover copper from leach solutions. He claims that the new process, involving a series of chemical reactions starting with natural gas and manganese or calcium sulphate, replaces and is superior to iron for

Dear Mr. Ditchburn:

This is in reference to my discussion with you and Mr. Griswold over the telephone on May 8, 1964, regarding a U. S. Bureau of Mines report on statistical studies on the subject property.

There is some misunderstanding concerning just what you had in mind as the Office of Minerals Exploration does not have anything to do with such studies. Possibly you were referring to the type of study undertaken at Climax, Colorado, by the Bureau of Mines in cooperation with the American Metal - Climax Company on sampling and data processing in the Bureau's computor at the Federal Center near Denver, Colorado. For information about this type of study, it is suggested you write to Mr. Robert Geehan, Area Director, Area V, New Custom House Building, Denver, Colorado.

Sincerely yours,

George Fumich, Jr.

Re: DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Dear Mr. Johnson:

We, too, cannot reconcile the 676 lbs. Mo in roasted moly oxide as shown in the third item of my letter of October 25th. This figure should have been 586 lbs. Mo. However, apparently we do agree in principle and I am arranging for our accounting department to pay royalty on the recent shipment from Questa on this basis.

We will accept the E&MJ Metal and Mineral Markets' quotation for molybdenum trioxide as the base price upon which royalty will be computed.

Yours very truly,

Wm. R. Kuntz
Executive Vice President

Taos County, New Mexico
Contract Idm-K1094

Dear Mr. Kuntz:

In reply to your letter of October 25, 1963, your method of computation of the royalty appears acceptable. However, reviewing your example for royalty calculations, we could not reconcile the 676 lbs. Mo in roasted moly oxide as shown in the third item. Will you kindly clarify this figure? Also, we note the price of $1.59 per lb. of Mo in the fourth item is the same figure as listed for molybdic trioxide in the October 21, 1963, issue of E & MJ Metal and Mineral Markets. Will this weekly price authority be the basis for royalty calculations?

Sincerely yours,

Re: DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Dear Mr. Fumich:

Replying to your letter of October 9th, the following are in answer to questions set forth therein.

1. We regret we cannot supply a schedule of our purchases of MoS_2 concentrates since this is high confidential information.

2. The actual percentage of loss in converting molybdenum concentrates to the oxide form at our Washington plant is 2.3%: i.e. recovery of 97.7%.

3. We would consider the time of receipt of the concentrates at our Washington plant as the time of sale of the roasted molybdenum oxide for royalty purposes.

Re: DMEA-4568

Questions (on item 4):

(a) How is 600 lbs. computed?

(b) How is 676 lbs the result of 600 x 97.7%?

(c) What is source of $1.59 price?

Talbut
10/28/63

Mr. George Fumich, Jr., Director October 25, 1963

4. The following is an example of how we would compute the royalty:

1,000 lbs. MoS_2 contained in concentrates.
600 lbs. Mo in concentrates. 1,586.2 lbs.
600 lbs. x 97.7% = 676 lbs. Mo in roasted moly oxide.
676 lbs. Mo x $1.59 = $1,074.84
$1,074.84 x 5% (royalty percentage) = $53.74
$53.74 = royalty.

We will compute and pay royalty for the shipment made from Questa on August 30, 1963 promptly after advice from you.

Yours very truly,

Wm. R. Kuntz
Executive Vice President

Re: DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Dear Mr. Kuntz:

With reference to your letter of September 26 to Mr. Connors, we will consider the suggestion of basing the Government's percentage royalty upon your selling price for roasted molybdenum oxide after adjustment for processing losses.

To assist us in reaching a final decision in this matter, would you kindly furnish us with the following information:

1. If available, a copy of your schedule for purchase of MoS_2 concentrates.
2. The estimated percentage of loss in converting the concentrate to oxide form.
3. Would you consider the date of receipt of the concentrates at Washington, Pa. as the date of sale of the roasted molybdenum oxides for royalty purposes?
4. Would you kindly give us an example of how you would compute the royalty in the manner you suggested.

Upon receipt and review of the above requested information, we will inform you of our decision in this matter.

Sincerely yours,

George Fumich, Jr.

Re: DMEA-4568 (Molybdenum)
Contract Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Connors:

Mr. A. L. Greslin has forwarded to us copy of your letter of September 18, 1963 regarding royalty on the recent shipment of molybdenite concentrates from Questa.

Your letter indicates that Article 6(c) of our contract requires that the 5% royalty be based upon sales value of the molybdenum in the form in which it is finally sold. The subject material has been shipped to our plant at Washington, Pa. where it will be used in the production of roasted molybdenum oxide which will be sold to customers in the steel industry. I am sure you can appreciate that it is impossible for us to maintain the identity of this particular material after it is charged into our roasting furnace. In view of this, we suggest that the sales value of the material be computed based upon our selling price for roasted molybdenum oxide after adjustment for processing losses.

Re: DMEA-4568 (Molybdenum)
Contract Kdm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Greslin:

Thank you for your letter of September 12, 1963 regarding the shipment of concentrates.

I presume that these concentrates were shipped east to the Molybdenum Corporation of America for further processing by them. If this is the case, please read Article 6 (c) of the contract which is as follows:

> Basis for computation.--The Government's royalty shall be a percentage of the gross proceeds (including any bonuses, premiums, allowances, or other benefits) from the production sold, in the form sold (ore, concentrates, metal, or equivalent), at the point of delivery (the f.o.b. point); except, that charges of the buyer arising in the regular course of business, and shown as deductions on the buyer's settlement sheets, on account of the cost of treatment processes performed by the buyer, sampling and assaying to determine the value of the production sold, and freight paid by the buyer to a carrier (not the Operator), shall be allowed as deductions in arriving at the "gross proceeds" as that term is used herein. Any costs of treatment processes, sampling, assaying, or transportation performed or paid by the Operator or by anyone other than the buyer are not deductible in arriving at the "gross

proceeds" as that term is here used. The term "treatment processes," as here used, means those processes (such as milling, concentrating, smelting, refining, or equivalent, but excluding fabricating or manufacturing) applied to the crude ore or other production after it is extracted from the ground to put it into a commercially marketable form.

You will note from the above that royalty applies to the production in the form in which it is sold. When this shipment of concentrates is sold by the Molybdenum Corporation of America in its final form, please forward this office two copies of the settlement sheet together with a check for 5 percent of the total shipment's value.

Mr. W. R. Griswold, Chief
Division of Minerals
United States Dept. of the Interior
Office of Minerals Exploration
Washington 25, D. C.

Dear Mr. Griswold:

On July 30, 1962 I mailed you M. M. E. Form 63, Revised 3-62 completed, giving the production for the period November 3, 1961 to July 30, 1962.

After others from the Company examined it, they didn't think we should report ore. They thought we should report only concentrates. At that time I wrote you for more blanks to correct this.

In the meantime I have talked to Mr. Romslo of the Bureau of Mines and he said this was filled out correctly, that the form should include ore, so please use the form that was filled out and sent to you on July 30, 1962.

This form does not include the production before November 3, 1961 which was 7,931 lbs of MoS2 in concentrates stored at the mill.

Yours very truly,

A. L. Gresham

Dear Mr. Carman:

Thank you for your letter of November 3, 1961 which advised me of the concentrates you have stockpiled at the mill.

I will appreciate receiving advice from you when the concentrates are shipped.

Yours very truly,

Re: DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Dear Mr. Connors:

According to the letter of certification of January 13, 1961 we are advising you of a production from our Questa Mine.

From September 28th through October 14, 1961 the concentrating mill at Questa was operated with a resulting production of 7,931 pounds of MoS_2 in concentrates. The material treated was accumulated over a long period by saving higher grade material resulting from mine exploration.

The mill was shut down on October 14th and no plans for resumption in the near future ~~is~~ are contemplated. Also, the concentrates produced are being stock piled at the mill to be shipped when enough are available for a car load shipment.

We will advise you of any change in this situation.

Yours very truly,

Dear Mr. Carman:

Your letter of April 3, 1961, to Mr. Hugh M. Connors, Acting Field Officer, has been referred to this office.

Enclosed are two Bureau of Land Management pamphlets, "Information in Regard to Mining Claims on the Public Domain" and "Mineral Patents--Information Relative to the Procedure for Obtaining Patent to a Mining Claim." We suggest that the Company proceed as required by the Bureau of Land Management with the patenting of the claims. Should the Bureau seek information from us relating to the claims and the subject DMEA contract, our files will be made available to that Agency.

Sincerely yours,

(signed) FRANK E. JOHNSON

Memorandum

To: George C. Selfridge, Chief
Division of Field Operations, OME
Washington 25, D. C.

From: Hugh M. Connors, Acting Field Officer, OME, Region III

Subject: Docket No. DMEA 4568 (Molybdenum)
Contract No. Idm E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Enclosed are the original and one copy of a letter from the Operator dated April 3, 1961 and two copies of my reply.

Mr. Carman was in this office recently and we discussed the matter of patenting of their lode locations. He was wondering if OME could be of any help to him.

As you know, with all the recent publicity regarding the subject property, many claims have been staked in the area and the little town of Questa is booming.

It appears to me that to protect the Government's royalty interest in the property, it behooves us to give what aid we can to the Operator in bringing the 19 subordinated, unpatented lode mining claims to patent. Neither Mr. Carman nor I know exactly what we can do to help, but we both know that patented claims are hard to come by these days. I am wondering if your contacting the Bureau of Land Management Officials in Washington regarding this particular property and the Government's interest therein, would be of any assistance.

I will be happy to receive your thoughts in this matter.

Re: Docket No. D.M.E.A 4568 (Molybdenum)
Contract No. Idm E-1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Connors:

The Questa Mine recently has had considerable publicity with the consequence that there has been an influx of claim locators in the area including at least, one large substantial company.

It is the desire of the Molybdenum Corporation to apply for patent on all the apparently eligible unpatented claims in the area.

As D.M.E.A. assisted in work done on several of these claims and currently examined the work when in progress, we believe verification by D.M.E.A. of any information in the application, with which they were concerned, would materially assist in the approval of the patent applications. This is of particular significance in regard to drill hole results and with respect to areas that have become or may become inaccesible by caving. Being familiar with the property, you will know the soft character of the ground and the difficulty we have in keeping it open.

We are not clear by just what method D.M.E.A.'s endorsement of results, if they were able to give it, could be accomplished. It might take the form of certifying the sample maps or making its information available to the patent examiners.

We feel that the elimination of any question of ownership of the claims under consideration would be to the Government interest as it due to its lien under the contract is in reality a part owner in the property until the lien is paid or has expired.

Thanking you for your consideration, we are

Yours very truly,

MOLYBDENUM CORPORATION OF AMERICA

DMEA-4568-Molybdenum
Contract Idm-E1094

OLD DISTRICT - NEW DEPOSIT

MCA Exploration Finds Large Molybdenite Prospect

New Mexico may contain a molybdenite deposit second only to that at Climax, Colo., according to a recent announcement by the Molybdenum Corporation of America. The new molybdenum prospect, approximately one mile west of the old Questa mine, comprises two separate, but nearby orebodies at depths exceeding 1500 ft. The importance of this deposit to MCA is underscored by the fact that, since the original Questa mine terminated operations in 1956, the company has had to rely on other producers of molybdenum to supply their manufacturing facilities at York and Washington, Pa. and Cleveland, Ohio.

As is true for much of the West, gold was the substance which first drew miners to this area of the Sangre de Cristo Mountains in the 1880's. In 1923, MCA purchased the Questa property and during the next 33 years, the company extracted 20 million lb of molybdenite from scattered high-grade veins which assayed from 3 to 8 pct MoS_2. After 1945, the high-grade veins encountered became fewer in number and in 1956, all mining was terminated at this site.

Exploration Progress: Initial exploration commenced in 1954 at Questa, two years prior to the cessation of the earlier mining operations. From June 15, 1957 to June 30, 1960, exploration work was conducted with the financial assistance of the Defense Minerals Exploration Administration (DMEA), now known as the Office of Mineral Exploration (OME).

The 1954 exploration program was aimed at locating extensions of the ore deposit then being tapped by the Questa mine. Molybdenite-bearing

The Questa mine as it appeared in 1925 when it was one of the largest producers of molybdenum in the world.

Claim Large Molybdenum Discovery

Molybdenum Corp. of America announced discovery of a large molybdenum deposit in north central New Mexico. Located near the town of Questa, in Taos County, the deposit involves some 260 million tons of indicated ore with a 5-pound-per-ton content of molybdenum disulfide, or the equivalent of 760 million pounds of refined metal. Exploratory work, which started in 1954, was financially aided in the past three years by funds from the Defense Minerals Exploration Administration. No plans for mining will be made until exploration work is completed. **See Page 14 for further details.**

Freeport Sulphur Opens New Mine

Freeport Sulphur Co. put in operation a new sulfur mine at Lake Pelto, some sixty miles southwest of New Orleans on the marshland shore of the Gulf of Mexico. Mining is being done from a barge-mounted plant, used originally a few miles to the north at the now depleted Bay Ste. Elaine deposit.

Inco to Expand Copper Cliff Iron Plant

International Nickel Co. of Canada Ltd. has scheduled an estimated $50 million expansion program slated to triple capacity of its iron ore recovery plant at Copper Cliff, Ont. The plant will treat 1.2 million tons per year of nickel-bearing pyrrhotite high in iron content. According to the company, the process involves solid state pyrometallurgical operations, and the removal of nickel by atmospheric pressure leaching in new high capacity units of company design. The expanded plant is scheduled to be in full operation in 1963. Inco said diversion of this large quantity of pyrrhotite to the new plant will effect a 40-pct decrease in the tonnage of material which would otherwise have to be handled by the nickel section of the Copper Cliff smelter.

Udall Named Secretary of Interior

Stewart L. Udall, Representative from Arizona, was named Secretary of Interior to the new administration, to replace incumbent Fred A. Seaton. Representative Udall, has been a member of the Mines and Mining Subcommittee of the House Committee on Interior and Insular affairs during his tenure in Congress.

Find Metal Deposit Below Barite

Canada's leading barite producer, Magnet Cove Barium Corp., has discovered a large lead-silver orebody beneath its big barite deposit at Walton, Nova Scotia. Some 450,000 tons of the metal ore, which grades better than $32 a ton, has been indicated down to the 850-ft level. A 125-tpd concentrator is planned for working the deposit, and should be completed in October 1961.

(Continued on page 16)

fractures found in granite gave rise to hopes of further mineralization occurring somewhere in the area. Since 1956, MCA has been doing underground drifting and diamond drilling in conjunction with some surface drilling. To date approximately 16,000 ft of tunneling has been done, and about 30,000 ft of drill core cut. Accompanying geological and geochemical work directed the exploration toward those areas now being extensively investigated.

Geology and Mineralization: Questa is underlain by early Tertiary volcanics ranging from andesites to welded rhyolitic tuffs. This volcanic series was intruded during the late Tertiary by granite porphyries, porphyritic aplites, and rhyolite porphyries. The geology of the area was recently described by Dr. Robert H. Carpenter at the 1960 International Geologic Conference in Copenhagen, Denmark.*

The molybdenite occurs principally in small veinlets within well-developed vein systems varying in width from several inches to more than a foot. The mineral is also found along fault planes within the country rock. It is thought that the introduction of the molybdenite and associated pyrite occurred after the reopening of small fractures within the host rocks.

Ore Reserves: As of June 1960, ore reserves calculated from drift and drill samples indicated 260 million tons of ore assaying 0.25 pct MoS_2, equivalent to about 760 million lb of contained molybdenum. During the last six months, however, additional exploratory work has extended the boundaries of the two orebodies and disclosed substantial zones of higher mineral content, both within and outside the area explored under the DMEA contract. Evaluation of these new findings indicate that the orebodies will attain or exceed an average molybdenite content of 0.5 pct.

MCA has announced their plans of continuing their program of drilling and tunneling to further define the two enriched zones, but no decision regarding possible mining operations will be made until the further exploratory work is completed.

* R. H. Carpenter; Hydrothermal Alteration and Mineralization at Questa, N. M. *Proceedings of the International Geologic Congress*, 1960, Section 18.

A. L. Greslin (left), Questa manager, and J. B. Carman, MCA mining engineer, examining ore from the new prospect.

(Continued from page 13)

Kaiser, Consolidated Zinc Plan Aluminum Complex

Kaiser Aluminum & Chemical Corp., and Consolidated Zinc Corp. Ltd. announced plans to establish a new aluminum complex in Australia and New Zealand. The agreement involves developing large bauxite reserves and hydroelectric power in construction of the largest integrated aluminum facilities in the southern hemisphere. By mid-1966, the following projects are scheduled to be completed: 1) Development of bauxite reserves in the Weipa area on Cape York peninsula, Australia. 2) Construction of a 360,000 long ton alumina refinery at Weipa. 3) Expansion of the Bell Bay, Tasmania, aluminum reduction works from annual primary capacity of 12,000 long tons annually to a minimum of 28,000 long tons. 4) Development of a hydroelectric source using the water of Lakes Te Anua and Manapouri in New Zealand. 5) Construction of a new aluminum reduction works at Bluff, New Zealand, with capacity of 120,000 long tons of primary metal yearly. 6) Establishment of fabricating facilities. During 1961 Kaiser will invest more than $10 million for developing and expanding the properties, which are presently held by Consolidated, and later will participate equally with Consolidated in construction of additional facilities.

Zinc, Copper Strikes Settled

A new wage pact ended the six-week-old strike at the Anaconda Co. Chuquicamata mine in Chile. An upstep in fringe benefits and a 25-pct increase in wages were included in terms of the settlement . . . . New Jersey Zinc Co. and United Steel Workers have come to agreement on a strike which had lasted since August 5. In new wage contracts that run until July 27, 1963, workers at two smelters and five mines will receive immediate wage increases of from 7½ or 8¢ an hour with an additional increase of 2½ to 5½¢ an hour on March 26, 1962.

Beryllium Notes

A third U. S. beryllium producer has entered the market. The organization is General Astrometals Corp., which will produce and sell beryllium products under licenses from French firm, Pechiney. Production is scheduled to begin in early 1961, with ore received from France . . . . U. S. Beryllium Corp. reports new beryllium deposits are being worked in the old Redskin mine in Park County, Colo., some two and a half miles from the Boomer mine—biggest U. S. producer.

Gold Dredge Begins Bolivia Operation

A subsidiary of South American Gold & Platinum Co. has started operating a gold dredge on the Kaka River in Bolivia. The dredge, expected to produce some 6000 oz of gold monthly, was bought in New Guinea, dismantled, and the parts flown to Bolivia for reassembly and use by South American Placers Inc.

Synthetic Quartz Crystals in Production

The first commercial mass production of synthetic quartz crystals has begun in the Merrimac Valley, Mass., works of Western Electric Co.

Re: DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Gentlemen:

Enclosed is a "Certification by the United States of America of a Discovery or Development Under an Exploration Project Contract." This certification covers all the land described in Article 2 of the subject contract.

By the terms of the Exploration Project Contract, as amended, and of the certification, all minerals mined or produced, or transported through DMEA workings, from May 31, 1957, to May 31, 1973, are subject to the Government's percentage royalty as set forth in the contract until the sum of $200,339.57 (subject to audit) is repaid or until May 31, 1973, whichever occurs first.

Royalty payments should be made to the Field Officer, OME, Region III, Building 20, Denver Federal Center, Denver 25, Colorado, by the purchaser, with checks drawn payable to the Office of Minerals Exploration. The purchaser should be advised to deduct royalties from the amount due on each shipment and send the check directly to the Field Officer. Each check should be accompanied by suitable evidence - such as copies of settlement sheets - showing the name of the purchaser, the quantity and grade of the products sold, and the price and charges, certified to be correct by the purchaser.

You are requested to notify the Field Officer of any changes in ownership or production rights that may have any effect on the Government's right to its percentage royalty. Your attention is called particularly to Article 2(c) of the contract relating to the preservation of the Government's right to a percentage royalty on production. Also when production starts, please notify the Field Officer. Thereafter, if production ceases for any extended period, please notify him accordingly at six-month intervals.

Sincerely yours,

(signed) FRANK E. JOHNSON

Washington 25, D. C.

Re: EMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

Dear Mr. Fredell:

Enclosed is a copy of a certification of discovery or development relating to Exploration Project Contract Idm-E1094. The contract, dated May 31, 1957, as amended, provided Government participation to the extent of 50 percent in an exploration project estimated to cost $510,500.00. Actual expenditures were $400,679.14, with the Government's share being 50 percent or $200,339.57.

Audited

Work completed consisted of 5777 feet of drifting and crosscutting, timbering 4130 feet, cutting drill stations 321 feet, and 21,419 feet of diamond drilling. In addition, during the contract period the Operator completed 5979 feet of crosscutting and drifting without Government assistance.

The Operator's estimate of indicated ore reserves resulting from the work is as follows:

	Areas Square Feet	Average Thickness Feet	Tons	Percent MoS_2	Pounds MoS_2
Block 1	911,326	812	61,679,960	0.2412	297,303,924
Block 2	1,519,250	852	107,866,750	0.253	545,805,755

Gentlemen:

Enclosed is a copy of the Report of Review on the subject exploration project contract. You will note the balance due the Operator is $500.00, which sum I have requested the Fiscal Section be reimbursed to you.

Yours very truly,

Contract Idm-E1094

As requested by your January 3 memorandum, a Report of Review covering the subject contract has been prepared. The original and two copies are attached.

If you concur in the facts as stated in this Report of Review, please make the distribution authorized by section 4 of OME Circular 2, dated February 17, 1960. If for any reason you do not concur, please return the original and both copies to this Division with your comments.

Specific confirmation by you of the number of units of work accepted is not deemed essential in the instant case. In future requests for Reports of Review, however, your conformance with the requirement of sub-item (b) under section 1 of OME Circular 2 will be sincerely appreciated.

Subject: DMEA 4568 (Molybdenum)
Contract Idn E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

The subject contract expired June 30, 1960 which was 57 months from the date of the contract.

An acceptable final engineering and geological report was received from the Operator October 17, 1960.

Records in this office indicate that a total of $199,[illegible]9.57 has been paid to the Operator. The sum of $500.00 was recommended to be withheld from reimbursement to the Operator pending resolution of matters prerequisite to closing the account in processing the Operator's final accounting report which was for the month of June 1960.

Will you please complete the audit report.

FINAL REPORT

FINAL REPORT

Enclosed are the original and two copies of a joint final engineering and geological report dated December 1960 by R. U. King, geologist U. S. Geological Survey and T. M. Romslo, mining engineer, U. S. Bureau of Mines.

The original and two copies of the Operator's final report were forwarded you by me on October 17, 1960.

The exploration work completed included 5,777 feet of drifts and a crosscut 21,419 feet of diamond drilling in 19 holes, and the analysis of 3,333 samples. The total accepted cost of the work was $400,679.14 of which the Government's share was $200,339.57.

The exploration work resulted in the discovery or development of a significant quantity of molybdenum ore.

It is recommended that a Certification of Discovery or Development be issued.

MOLYBDENUM CORPORATION OF AMERICA
MOLY OR QUESTA MINE
TAOS COUNTY, NEW MEXICO

INTRODUCTION AND SUMMARY

The Molybdenum Corporation of America applied for Governmental aid in explorations for molybdenum in the area of its Moly or Questa mine, Taos County, New Mexico. Proposed explorations comprised driving 8,500 feet of drifts and crosscuts at an estimated total cost of $471,803.30.

The Moly mine, situated in the rugged Taos range of the Sangre de Cristo mountains of North Central, New Mexico, was productive from 1923 to 1953 when known high grade ore bodies were exhausted. (Fig. 1 & 2).

At the Moly mine, Pre-Cambrian granitic rocks are overlain by Tertiary volcanic rocks. Late Tertiary granite intrudes all the older rocks. Structurally the mine is in a long east-west down-faulted zone that trends across the Taos range.

Molybdenum appears to be the only important metal in the area and the Moly mine has been the only significant producer. Molybdenite, the ore-bearing mineral in the Moly deposit, occurs mainly in veinlets and as fracture filling in a zone over 1,000 feet thick along the contact of altered andesite and granite, but also occurs as disseminated grains, principally in the andesite.

The property was examined for the Defense Minerals Exploration Administration by D. E. Redman, U. S. Bureau of Mines, and D. N. Richter, U. S. Geological Survey, December 14, 1956. They were accompanied by A. L. Greslin, the applicant's resident manager. Their favorable findings resulted in execution of contract No. Idm. E1094, which authorized a 2-stage project costing an estimated total of $510,498.75, with Government participation of 50 percent.

Project work began June 15, 1957 and continued to June 30, 1960, when the contract expired. During the life of the project, the Operator did much additional work at no expense to the Government. Completed project work included 5,777 feet of drifts and crosscut of which 4,310 feet was timbered, 21,419 feet of diamond drilling in 19 holes, and the analysis of 3,333 samples. The diamond drilling also involved 321 lineal feet of advance for drill sites and the cementing and redrilling or the reaming and casing of 1,000 feet of hole. Analyses of individual samples from all tunnelling and drilling completed under the contract are shown on one inch to 50 feet scale plan maps accompanying the Operator's final report. Total cost of the work was $400,679.14 of which the Government's share was $200,339.57.

Reserves of molybdenum-bearing rock discovered as a result of DMEA and Company exploration completed during the life of the contract, amount to two and a half billion tons containing better than 0.20 percent MoS_2. ? Smaller concentrations of commercial grade ore occur within this extensive mass of mineralized ground, which may be of sufficient tonnage to be mineable under present conditions. How much?

The Operator calculates a reserve of indicated ore amounting to 259,939,376 tons at 0.243 percent MoS_2.

Considerable exploration will still have to be done before a complete evaluation of the molybdenum reserves and potential of this property can be made, but because of the significant tonnage of potential molybdenum ore found as a result of the exploration carried out under the contract, it is recommended that the property be certified as a discovery.

THE PROJECT

The project authorized by contract number Idm. E1094 was started June 15, 1957 and was completed shortly before the contract was terminated by mutual consent, June 30, 1960. Claims subordinated by the contract are shown on figure 3. Project explorations totalling 5,777 feet of drifts and crosscuts and 21,419 feet of diamond drilling, were supplemented by a considerable amount of work carried out at no expense to the Government by the Operator. Additional exploratory work was in progress when the project was completed.

Tabulated below is a summary of the authorized and completed work with costs, and pertinent operational data of the drifting and crosscutting, and diamond drilling.

Figure 4 shows the underground workings and drill holes completed with and without Governmental aid.

Table III. Diamond Drill Hole Data

Core recovery, by holes, ranged from 5.90 percent to 59.89 percent and averaged 36.95 percent of the total footage drilled. Through hole No. 23 the core recovery by the initial drilling contractor had averaged 25.53 percent. Thereafter, another contractor was able to increase recovery to an average of 45.45 percent.

Core recovery was low mainly because the major portion of the drilling was in highly altered 'green rock' which disentegrates rapidly when ground with water.

Geology and Ore Reserves

The Questa molybdenum mine is on the west flank of the Taos range of the Sangre de Cristo Mountains in northern New Mexico. Precambrian granitic and metamorphic rocks that are overlain by Tertiary volcanic rocks make up most of the western part of the range. Small patches of sedimentary rocks presumably of Permo-Triassic age are present in the area. The Tertiary volcanic rocks consist of andesite, latite and rhyolite flows, breccia and tuff, which are in places so highly altered as to obscure original textures and structures. Late Tertiary soda granite, aplites and rhyolite porphyry intrude all older rocks.

The major structural features of the area are high angle normal faults and thrust faults. The Tertiary rocks in the vicinity of the Questa mine occupy a broad-structural trench that trends eastward across the Taos range. The southern boundary of the trench, which is approximately along the Red River, is marked by a series of east-trending normal faults that dip steeply northward. This downfaulted zone is probably the major control for the emplacement of a soda granite stock, with which the molybdenum deposit seems to be genetically related. The stock is elongate in a westerly direction from its outcrop at the original mine workings in Sulphur and Blind Gulches.

Along the western and southwestern contact of the granite stock with the overlying volcanic rocks is a thick zone of fractured and hydrothermally altered rocks. The altered rocks, visible at the surface, exhibit highly colored scars and bad land topography on the steep-walled mountain slopes.

Sulfide mineralization that has accompanied the hydrothermal alteration consists chiefly of molybdenite and pyrite. Only traces of copper, lead, zinc, tungsten, and precious metals are present in the mineralized area.

Propylitization of the Tertiary rocks as well as of adjacent Precambrian rocks is a characteristic feature of the deposit. Gangue minerals, in addition to large amounts of quartz, formed as a result of the hydrothermal alteration include chlorite, sericite, kaolinite, epidote, calcite, fluorite, rhodochrosite, and biotite.

In the higher parts of the deposit and along a thin band close to the contact of the andesite and granite, molybdenum occurred in high grade (5 to 30 percent MoS_2) molybdenite-quartz veins. In a much thicker band, that ranges up to one thousand feet in thickness, molybdenite is dispersed throughout the fractured and altered rocks in quartz veinlets and on fault and fracture surfaces as "paint". The full thickness, attitude and lateral extent of the molybdenite-bearing ground has not been determined, although exploration (including former mine development) has been conducted over a vertical range of more than 2,000 feet and over an area of one mile square.

With the exception of the high grade quartz-molybdenite veins, which were the source of relatively small tonnages of ore, mined during the past 30 years, the tenor of the deposit is low and very uniform, ranging from about 0.05 percent to 0.5 percent MoS_2. From the two miles of exploration drifts, and 21,000 feet of core drill holes less than a dozen samples contained more than 1. percent MoS_2 or less than 0.01 percent MoS_2.

The area explored by drifting and crosscutting during the life of the DMEA contract, from 1957 to 1960, measures about 5000 feet north to south and 5000 feet east to west. During the same period diamond core drilling from the exploration level reached 400 feet above and 800 feet below the level. Only at the extremities of the drifts and crosscuts has the tenor of mineralization fallen below 0.1 percent MoS_2, and although some drill holes in marginal areas averaged less than 0.2 percent MoS_2, other holes bottomed in material averaging considerably better than 0.2 percent MoS_2.

Because of the homogeneous character of the molybdenum deposit it can be reasonably assumed that the entire mass of mineralized rock within the limits of exploration will contain better than 0.2 percent MoS_2. On the other hand, the wide and irregular spacing between exploratory openings precludes the computation of measured or indicated reserves for the entire block of ground.

For the purpose of simplifying reserve estimates, the ore body is assumed to occupy a block of ground 5000 feet on a side by 1000 feet thick. It is estimated that the inferred reserves at Questa are at least 2.5 billion tons of molybdenum-bearing rock containing better than 0.20 percent MoS_2. Within this large low grade body the presence of two small blocks of commercial grade ore (0.5 percent MoS_2) are indicated. The two blocks estimated to contain inferred reserves of 10 million tons each are in (1) the southwest part of the explored area between Nos. 4 and 5 south crosscut in the vicinity of drill holes 22, 27, and 30, and in (2) the north east part at the junction of No. 1 crosscut north and No. 3 drift east.

The Operator calculates indicated reserves of 259,936,376 tons of ore containing 0.243 percent MoS_2, distributed in three blocks. The grade of the reserves are mechanical averages of continuous wall chip sample analyses and drill hole sludge sample analyses, but the basis for the block boundaries are not given.

Conclusions and recommendations

Although the limits of the molybdenite deposit at the Questa mine have not been completely determined, exploration carried out with Government participation under the DMEA contract, has been sufficient to reasonably delineate a tremendous deposit of molybdenite and sampling of the deposit has been adequate to estimate very significant inferred reserves of molybdenum.

Molybdenum Corp. Says It Has Located Large Deposit in New Mexico

Site Said to Contain 260 Million Tons of Ore Holding About 760 Million Pounds of Metal

By a Wall Street Journal Staff Reporter

NEW YORK — Molybdenum Corp. of America announced it has located a large molybdenum deposit about six miles from the town of Questa in the Red River mining district, Taos County, north central New Mexico.

Exploration started in 1954. For the past three years it was carried on with the financial assistance of the Defense Minerals Exploration Administration of the Interior Department.

Marx Hirsch, president of Molybdenum, said the find was of major significance.

The company's final report to the Government agency disclosed about 260 million tons of ore containing about five pounds of molybdenum disulphide a ton, equivalent to approximately 760 million pounds of molybdenum metal.

Further Deposits Found

Mr. Hirsch said that in exploration since June 30 additional zones of higher mineral content have been located both within and outside the area explored under the administration contract.

"No decision will be made regarding possible mining operations until the conclusion of the exploratory work in the enriched area," Mr. Hirsch said. The company has a 50-ton mill at the property which can be expanded to 500 tons a day by additional crushing capacity.

A company official noted, however, that to economically mine and mill an orebody of the size indicated would require a multi-million dollar installation.

Molybdenum is an increasingly important metal to the nation's space and missile programs and to industry, the company said. For many years the free world has primarily depended on the large deposit of American Metal Climax, Inc., in Colorado, and on by-product production from copper mining.

The proven ore reserves of American Metal Climax, the largest single mine deposit in the world, total more than 450 million tons containing over two billion pounds of recoverable molybdenum. Frank Coolbaugh, American Metal Climax president, recently said that this figure could be doubled easily by indicated, but still undefined ore reserves at the American Metal Climax mine. It currently is operating at a rate of 33,000 tons a day of ore mined, and is expected to produce around 50 million pounds of molybdenum in 1960. This rate could be boosted another 10% to 15% with current mining and processing facilities, Mr. Coolbaugh said.

Industry sources estimate that about 16 million pounds of molybdenum will be recovered in the U.S. this year as a by-product of copper mining. The bulk will be produced by Kennecott Copper Corp. The copper mine output of molybdenum this year and last was handicapped by strikes at the copper properties that started in August 1959 and continued into the first quarter of 1960.

In 1959 the free world consumption of molybdenum was about 60 million pounds. Molybdenum contained in mine concentrates currently sells for $1.25 a pound.

Uses Are Expanding

Currently, about 80% to 90% of molybdenum's use is in iron and steel alloys to which it imparts added strength, Molybdenum Corp.'s announcement said. There are many other uses, and technological advances are accelerating. In 1959 the U.S. Bureau of Mines said Government scientists had produced the first casting of molybdenum.

The metal's high melting point, thermal shock resistance, good electrical conductivity and resistance to corrosion in certain mediums have resulted in use in various areas of the defense program. Its strength at high temperatures is of particular interest to scientists working on re-entry and other space problems where missile parts are subjected to intense heat.

Molybdenum Corp. of America has been producing molybdenum products since 1920. The company also produces ferro alloys, chemicals and pure metals of tungsten, columbium, boron and rare earths. Its plants are at Washington and York, Pa., and at Cleveland.

Western Trade Winds

Major Molybdenum Deposit Found Near Questa, N.M.

By WARREN LOWE
Rocky Mountain News Business Editor

Existence of a major molybdenum deposit near Questa, N.M., 20 miles south of the Colorado border, has been confirmed by a 3-year-old exploration program, Marx Hirsch, president of the Molybdenum Corp. of America, announced Tuesday.

An ore body of an estimated 260 million tons, containing about five pounds of molybdenum disulphide per ton, has been determined so far, Hirsch said.

Lowe

He added the company intends to continue and intensify exploration activities.

Molybdenum Corp's. Questa Mine property consists of approximately 3000 acres in the Red River mining district, six miles from Questa in Taos County.

The company operated the mine from 1923 to 1958, recovering molybdenum disulphide from scattered high-grade veins. Some 20 million pounds of molybdenum were mined from the property's 30 miles of underground tunnels and drifts.

Starting about 1946, fewer and fewer high grade veins were discovered and in 1958 mining was halted.

The following year the company started exploration under a loan agreement with the Interior Department's Defense Minerals Exploration Administration.

Approximately 16,000 feet of underground drifting and 30,000 feet of drill holes were completed under the agreement to determine the extent of the deposits.

In charge of the exploration have been John B. Carman, a company engineer for 40 years; Albino L. Greslin, resident manager, and Dr. Robert H. Carpenter, professor of mining geology at the Colorado School of Mines.

Molybdenum is designated as a strategic and critical material for stockpiling in the United States. For many years, the free world's supply has been the large deposit at Climax, Colo., and a by-product of copper mining.

Hirsch said no decision will be made regarding possible mining operations at the Questa properties until completion of additional exploration work.

Molybdenum Corp., organized in 1920, currently is primarily engaged in processing of molybdenum, tungsten, columbium, boron and rare earths. Its manufacturing plants are in Washington and York, Pa., and Cleveland, Ohio.

From: Chief, Division of Field Operations

Subject: IMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract Idm-E1094

We have the November 10 memorandum of Mr. Romslo concerning the Lonesome No. 1 claim. No work under the contract was done within the boundaries of this claim, nor is it mentioned in the title documents pertaining to Amendments Nos. 3 and 4. We, therefore, are not in a position to demand its inclusion into the contract, nor do we consider it as necessary, inasmuch as the Special Agreement Concerning Royalty in Annex No. II appears to adequately protect the Government's interest.

From: Hugh M. Connors, Acting Field Officer, OME, Region III

Subject: Docket No. DMEA 4568 (Molybdenum)
Contract No. Idm. E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

While preparing a claim map for the final report on the subject project I found that the Lonesome No. 1 claim has not been included as part of the subordinated ground. The Lonesome No. 1 claim which is shown on the claim map attached to and described in Amendment No. 3 is within the area subordinated by Amendment No. 4.

Execution of an amendment making the Lonesome No. 1 claim a part of the subordinated ground appears to be in order.

Mr. J. B. Carmen, of Molybdenum Corporation of America, telephoned this office late yesterday relative to publicizing the results of the DMEA work by the Corporation's New York office after approval by the Interior Department. He wanted to know when our Final Report would be submitted because Interior's decision apparently was largely dependent upon findings of the report.

I told Mr. Carmen, that we were working on our Final Report as time permits, and would submit it as soon as possible.

The U.S.G.S. is cooperating with us in the preparation of the report which we now hope to complete about the middle of next month.

Final Report

Mr. Hugh M. Connors
Acting Field Officer, O.M.E.
Field Team, Region III
Building 20, Federal Center
Denver 25, Colorado

Docket No. D.M.E.A. 4568 (Molybdenum)
Contract No. Idm E-1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Sir:

Persuant to the contract we submit the following Final Report:

INTRODUCTION

We applied on December 3, 1956 for government assistance under D.M.E.A. for the exploration of an area about 4000 feet E-W by 4800 feet N-S. This area lying to the west adjoins a mined area that produced 20,000,000 pounds of molybdenite. On May 31, 1957 the Government offered a contract which conditionally approved 7160 feet of drifting and crosscutting and 28,500 feet of core drilling on a fixed unit cost basis. Work started on June 15, 1957. Time for completion of work originally was 30 months. Under Amendment No. 4, a 7 months extension was granted making the termination date June 30, 1960.

AMENDMENTS

The contract was amended as follows:

Amendment No. 1, October 4, 1957 referred to Exhibit A, Stage I, Project Area B. It conditionally allowed extension of the Second Tunnel Shaft Level, Drift West 500 feet.

Amendment No. 2, January 6, 1958 referred to Exhibit A, Stage II, Area B and provided for (1) Substitution of sludge samples for core samples when insufficient core was recovered;

(2) Allowed the extension of Drift West (mentioned above) to 400 feet west of coordinate W 400 and provided for, with Government approval, north and south crosscuts from this Drift West and allowed drifting from the crosscuts following the strike of favorable zones encountered. It limited 400 feet the distance between north and south crosscuts driven in the same direction.

Amendment No. 3, June 23, 1959 referred to Areas A and B and provided for drifting and drilling and the subordination of more claims under the contract, namely, Summit Nos. 4, 5, 7, 8 and 16.

Amendment No. 4 provided for (1) Extension of termination time to June 30, 1960.

(2) Changing from 15 years to 16 years the time in which royalties are payable to the Government.

Contract No. Idm E-1094
Molybdenum Corporation of America

(3) Detail and Items of contract termination including "Final Report", obligations of successors, exclusion of Government from any claims arising out of contract.

(4) In Annex I the addition of the claims Buena Vista Nos. 1, 2, 3, 4, 6, 7, Torbert No. 2 and Renegade on which proof of title had been given by operator.

(5) Also Annex I claims Phyllis Nos. 5 and 7, operator owned were added.

UNASSISTED WORK

During the contract term the operator did the following drifting and cross-cutting without Government assistance on the 2nd Tunnel Shaft Level. (These distances scaled from Plates.)

Drift West	77 feet
Drift West No. 1 Cx North	2560
Drift West No. 1 CxoN No. 4 Dft West	90
Drift West No. 1 Cx N No. 3 Dft East	992
Drift West No. 2 Cx North	68
Drift West No. 2 Cx South	50
Drift West No. 4 Cx South	131
Drift West No. 5 Cx South (Old)	80
Drift West No. 7 Cx North	1931
Total	5979 feet.

GEOLOGICAL EVALUATION

Work performed under the contract together with other work done simultaneously by the operator, disclosed a very considerable area of molybdenite mineralization, both on the 2nd Tunnel Shaft Level (elevation about 7800 feet) and for several hundred feet vertically above and below the level, see Plates Nos. VI, VI a, VII and VIII.

It showed the Questa mine porphyry intrusive body, although elongate north-south on the surface to extend westward underground as a gently plunging intrusive ridge well mineralized on the south flank with promising mineralization to the north on what appears to be the north flank of the ridge.

It disclosed much of the mineralization situated within or near the transitional contact zone between the porphyries and the volcanic country rocks. It also indicated zones of strong mineralization well below the contact. As, for example, the results of Drill Hole No. 37 at coordinates N 1836, E 638, Plate VII as well as several hundred feet above the contact.

It showed molybdenite to occur with quartz and pyrite in small veinlets, in well developed veins several inches to a foot or more in width and as a thin veneer or paint on joint and fault surfaces. By far the greatest volume of molybdenite occurs in the last manner. The molybdenite appears to have a considerable temperature range of deposition as it is interbanded with biotite along some vein

Final Report
Docket No. D.M.E.A. 4568 (Molybdenum)
Contract No. Idm E-1094
Molybdenum Corporation of America

edges and its occurrence as veneer or paint appears to have been formed after most all other mineralization had ceased.

The work disclosed that the major control of molybdenite deposition has been cracking during late stage cooling of the porphyry intrusive body and subsequent failure. The entire contact fringe underwent structural adjustment resulting in innumerable openings which became mineralized.

Strong mineralization was found in all rock types, both intrusive and volcanic. Rock brittleness appears to have a more profound effect on fracture development than the initial rock composition. Hydrothermal alteration, in a sense, has played an important role in preparing the rock for cracking. Those rocks in which there has been an addition of silica and potash feldspar are more favorable than those which have been strongly sericitized or kaolinized.

Cracking and subsequent mineralization is better developed generally in areas of contact irregularities than in more uniform sections. Intersecting dikes and offshooting projections have been noted where mineralization is strong.

Exploration to date gives no geologic indication that higher concentrations of molybdenite may not be found by both intermediate exploration within, and exploration adjacent to the more favorable areas indicated by the widely spaced work done.

ORE EVALUATION

The relatively small amount of exploration work done compared to the large volume of molybdenite bearing material precludes an assured evaluation of any tonnage of a certain grade, consequently the following must be considered as indicated ore.

This evaluation is made by using the chip sample results from the drifts and crosscuts and the drill hole sludge sample results. Regarding the use of sludge versus core samples, first, core recovery varied from 5.9% to a maximum of 59.89% with an overall average of 36%; and second, experience has demonstrated the better mineralized sections are usually in soft or friable material difficult to core.

In arriving at a tonnage figure, a factor of 12 cubic feet per ton is used.

Memorandum

To: George C. Selfridge, Chief
Division of Field Operations, OME
Washington 25, D. C.

From: Hugh M. Connors, Acting Field Officer, OME, Region III

Subject: Docket DMEA 4568 (Molybdenum)
Contract Idm-E1094
Molybdenum Corporation of America
(Questa mine)
Taos County, New Mexico

This responds to your memorandum dated September 26, 1960 on the subject project.

Mr. J. B. Carman, of Molybdenum Corporation of America, telephoned this office today requesting information regarding the final report on the subject property. He estimates that the final report will be forwarded this office the week of October 10, 1960.

Hugh M. Connors

Taos County, New Mexico

Dear Mr. Greslin:

In reference to your letter dated June 16, 1960, this constitutes concurrence by the Government for you to stop drilling Hole 43A.

Nothing in the above work approval shall be construed to increase the estimated total cost of the project, the aggregate amount which the Government may be required to contribute, nor the "Fixed Unit Cost" of any item of work.

Very truly yours,

Contract No. IDM-E 1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Sir:

We ask you herewith for approval to stop drill hole No. 43-a.

We drilled drill hole No. 43 to a depth of 136 feet and had to stop due to caving ground in the hole. Then, with your approval, we tried drilling hole No. 43-a at the same location but at an inclination of plus 80 degrees South.

We drilled to a depth of 66 feet in drill hole No. 43-a but couldn't go any farther due to caving ground in the hole and too much sand in the hole that would stick the rods and couldn't get the rods in or out of the hole.

Yours very truly,

A. L. Greslin

Dear Mr. Greslin:

In reference to your letter dated June 6, 1960, this constitutes concurrence by the Government for you to stop drilling Hole No. 43 at 136 feet and to drill another hole (No. 43A) at the same location as No. 43 but drill this one at an inclination of plus 60° South.

Nothing in the above work approval shall be construed to increase the estimated total cost of the project, the aggregate amount which the Government may be required to contribute, nor the "Fixed Unit Cost" of any item of work.

Taos County, New Mexico

Dear Sir:

We ask you herewith for approval to stop drill hole No. 43 at 136 feet.

Drill Hole No. 43 was drilled AX to 136 feet but had to stop due to caving ground to the extent that we couldn't get into the hole nor out with the drill rods. We tried to ream the hole to BX to case it but the rock was too loose to ream and the hole has become too large to do any good reaming.

We ask your approval to drill another hole (No. 43a), at the same location as No. 43 but drill this one at an inclination of Plus 80 Deg. South.

We will try to drill this one BX to get through the broken up zone before going to AX size.

Yours very truly,

A. L. Greslin

Memorandum

To: Fiscal Section, Division of Administrative Services
Office of the Secretary
Department of the Interior
Washington 25, D.C.

From: Hugh M. Cummore, Acting Field Officer, GMK, Region III

Subject: Docket No. [illegible]-4968 (Molybdenum)
Contract No. IBm-H1094
Molybdenum Corp. of America
(Questa Mine)
Taos County, New Mexico

In conformance with GMK Circular 1, enclosed are the original and two copies of Forms MF-104 and MF-104A with attached maps and other pertinent data, Operator's Narrative Report, and Engineer's Inspection Report covering work performed during the month of April 1960.

It is considered that the Operator has complied with the intent of the contract, and the work for which reimbursement is claimed is acceptable to the Government. All of the work was performed at Fixed Unit Cost under the short form of contract on Form MF-2-100A; therefore, documentation of the cost is not required.

It is recommended that reimbursement be made to the operator for 50% of the amount reported in Form MF-104 subject to final audit of the operator's accounts.

Dear Mr. Greslin:

In reference to your letter dated April 22, 1960, this constitutes concurrence by the Government for you to consider Diamond Drill hole No. 40 completed to a length of 732 feet, since the drill machine is no longer able to rotate the rods any deeper than the 732 feet. In addition, drilling to a depth of 732 feet has provided the information for which the hole was originally designed.

Very truly yours,

Dear Sir:

We Ask you herewith for approval to stop drill hole No. 40 at 732 feet.

Drill hole No. 40 was drilled B X to 211 feet and cased. The balance was drilled A X without casing, But due to the change in rock in the hole we didn't have enough power with the drill machine to rotate the rods any deeper than the 732 feet.

We drilled through the porphyry at 676 feet, then into transition rock.

Dear Sir:

We ask you herewith for approval to stop drill hole No 38. It was drilled [illegible] to 190 feet then [illegible] to 422 feet. We drilled in porphyry to 223 feet where we hit the contact to the transition rock and it was transition rock from there to 422 feet where we hit very bad caving ground.

We drilled through this caving ground a few times to get to the bottom of the hole but everytime we would drill through it it would get worse, therefore we had to pull out of the hole at 422 feet.

Yours very truly,

Re: Docket No. DMEA-4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America
(Moly or Questa mine)
Taos County, New Mexico

Dear Mr. Carmen:

In reference to your letter dated February 16, 1960, the following six (6) items of work are conditionally approved for performance under the provisions of Contract No. Idm-E1094, pertaining thereto, with the understanding that every effort will be made to complete all six items of the work on, or before June 30, 1960 as provided for in Amendment No. 4 dated November 25, 1959. It is to be further understood that the Government will not contribute to the costs of a partially completed item of work; therefore, reimbursement to the Operator for the Government's portion of the costs of an individual item of work will be deferred until the item of work is completed to the satisfaction of the Government, and an appropriate accounting report and voucher is submitted by the Operator.

Item	Diamond Drill Hole No.	Location	Approximate Coordinates of Collar	Inclination	Bearing	Maximum Length
(1)	41	No. 1x-Cut N	2800N-1000E	0°	East	500 ft
(2)	42	No. 1x-Cut N	2800N-1000E	-90°	0	500 ft
(3)	43	No. 3 Drift E	2340N-1400E	+90°	0	500 ft
(4)	44	No. 3 Drift E	2340N-1400E	-90°	0	500 ft
(6)	45	No. 2x-Cut S, Westerly Drift	750S-1000E	-60°	South	800 ft

(5) Drive a drift a distance of 500 feet on a bearing of approximately S30°W from the most southwesterly face of the No. 2 crosscut South. The drift is to start at approximate coordinates 300S-1250E and end at approximate coordinates 750S-1000E, the location of Diamond Drill Hole No. 45, above.

Nothing in the above work approval shall be construed to increase the estimated total cost of the project, the aggregate amount which the Government may be required to contribute, nor the "Fixed Unit Cost" of any item of work.

February 26, 1960

Memorandum

To: Executive Officer, OME Field Team, Region III
Through: J. W. Hasler JWH

From: R. W. King
T. N. Rosale

Subject: Docket No. DMEA 4568 (Molybdenum), Contract IGm-E 1094, Molybdenum Corporation of America, Taos County, New Mexico

In a letter dated February 16, 1960, the operator of the subject contract requested approval of five core drill holes and 500 feet of crosscut tunnel. Justification of the request is contained in a supplemental geologic report dated February 16, 1960, by R. H. Carpenter, consulting geologist for the operator.

The first four holes are in the northeastern part of the contract area and will explore favorable mineralized ground made accessible in part by drifting under the contract (No. 3 drift east) and in part by crosscutting at the operator's sole expense (No. 1 X-cut north).

The fifth drill hole will explore ground to the south of the West drift about on coordinate K1,000 that is thought to be favorable for the occurrence of higher grade molybdenite mineralization. This interpretation is based on the results of early DMEA holes including holes 8A, 10, 11, and 13A, and of the more recent drill holes Nos. 27, 30, and 32.

In order to reach the area in question by drilling (1,000E and 1,200S), access will be needed for a drill station at about coordinate 750 S, 1,000E. The proposed crosscut is necessary to provide this access.

It is recommended that the operator's request to perform the following items of exploration be approved:

Item Drill hole	Location	Collar coordinates	Bearing	Inclination	Estimated length
41	No. 1 X-cut N	2800N, 1000E	East	0°	500
42	No. 1 X-cut N	2800N, 1000E	--	-90°	500
43	No. 3 Dr. E.	2350N, 1400E	--	+90°	500
44	No. 3 Dr. E.	2350N, 1400E	--	-90°	500

Crosscut from 300S, 1250E, to 750S, 1000E, an estimated distance of 500 feet, and drill proposed hole No. 45 from face of crosscut (750S, 1000E) due south at -60° for an estimated length of 800 feet.

Re: Docket No. DMEA 4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

We herewith make application for the following drifting and drilling on the 2nd Level.

It is our understanding that the reasons for this request have been given by our geologist Dr. Robert H. Carpenter in conference with Messers Hasler and King on February 11th.

ITEM	HOLE NO.	LOCATION	APPROX. COORDINATES		INCLINATION	BEARING	MAX DEPTH
(1)	41	Cx No. 1 N	2800 N	1000 E	0°	East	500 ft.
(2)	42	Cx No. 1 N	2800 N	1000 E	-90°	0	500 ft.
(3)	43	Cx #1 N Dft #3 E	2340 N	1400 E	plus 90°	0	500 ft.
(4)	44	Cx #1 N Dft #3 E	2340 N	1400 E	-90°	0	500 ft.
(6)	45	Dft W Cx #2 S	750 S	990 E	-60°	S	800 ft.

DRIFTING

(5) A crosscut to be driven from the southwest face of "No. 2 Drift South starting from approximate coordinates 300 S - 1240 E on a course of S 30° W for 500 feet. Item (6) above to be drilled from the face of this drift when completed.

Yours very truly,

MOLYBDENUM CORPORATION OF AMERICA

SUPPLEMENTAL DATA IN SUPPORT OF REQUEST TO O.M.E. DATED FEBRUARY 16, 1960

Very encouraging assay results and geologic data have been obtained in No. 3 Drift East and in No. 1 XCN around the western fringe of what appears to be the vertical projection of the western flank of the porphyry plug which outcrops in upper Sulfur Gulch. Mineralized fault zones and high grade 4 to 18 inch veins together with mineralization occurring along small cracks and fractures have resulted in an overall average of 0.45% MoS_2 in the first 500 feet of No. 3 Drift East. Most of these structures trend northerly and dip westerly.

In order to round out exploration in this northeast area under O.M.A., the following diamond drilling is recommended:

1. Hole No. 41---to be drilled on a due east bearing at 0° for a distance of 800 feet from Crosscut No. 1 North at approximately 2800 N, 1000 E. The purpose of this hole is to crosscut the mineralized structures intersected in No. 3 Drift East along a line some 450 feet north of this drift.

2. Hole No. 42---to be drilled vertically downward (-90°) for a distance of 500 feet from the same location as Hole No. 42. This hole will yield third dimension geologic and assay data.

3. Hole No. 43---to be drilled vertically upward (+90°) for a distance of 500 feet from No. 3 Drift East. The location of this hole will be in the neighborhood of 2340 N, 1400 E; the exact location will be dependent on geologic relationships. The purpose of this hole is to test the mineralization along the western fringe of the porphyry plug.

4. Hole No. 44--- to be drilled downward (-90°) from the same location as Hole No. 43. This hole will test the geologic relationships and mineralization at depth in the root zone of the porphyry intrusive plug.

The mineralization encountered in the southwestern part of the exploration level suggests a sizable area of strong mineralization, the boundaries of which have yet to be established. In order to delimit this area to the east of No. 4 XCS the following exploration work is recommended:

5. A crosscut should be driven from the southwest face of "No. 2" Drift South starting from approximately 300 S, 1240 E on a course of S 30°W for 500 feet. This crosscut will explore more fully the hanging wall of the southwest flank of the westerly plunging porphyry intrusive ridge, and establish a face from which the northerly dipping dikes, projected eastward from No. 4 XCS, may be intersected by drilling.

6. Hole No. 45---to be drilled from the face of the proposed crosscut described under No. 5, will be drilled on a due south bearing at a -60° inclination for a distance of 800 feet. This proposed hole is

shown on accompanying Cross Section L - M which illustrates the relationships between northerly dipping dikes and the porphyry intrusive ridge along 1,000 E.

The northerly dipping quartz porphyry dikes referred to under 5 consist of Goat Hill type porphyry. They were encountered in No. 4 MDS between the stations from which diamond drill holes 27 and 30 were drilled; they were intersected by diamond drill holes 22, 31, and 32 as well. They appear to be dipping about 80° to the north, and trending easterly. The strong mineralization which occurs in holes 27, 30, and 22 is situated within, between, and below these dikes.

The zone representing the trace of intersection between these dikes and the westerly plunging granite porphyry intrusive ridge may be a potential ore zone. It's trace is believed to be westerly along the southern flank of the granite porphyry fringe, and arcuate to the northwest below the western part of the exploration level. The mineralization in holes 22 and 27 probably represents post intrusive cracking along this zone of intersection.

It is my opinion that these northerly dipping, easterly trending dikes are a part of a regional system of faults which have controlled the general outline of the Red River trench of volcanics of intermediate composition. These "green rocks" subsequently were intruded by granite porphyries, aplites, and quartz porphyries.

Respectfully submitted,

Robert H. Carpenter

From: Chairman, Operating Committee, OME

Subject: Docket No. DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract No. Idm-E1094

This is in response to your memorandum of December 21, 1959, relating to the provisions of Item 3 of Amendment No. 4. The pseudo-certification will be effective only if all authorized work has not been completed by June 30, 1960.

Mr. R. U. King's memorandum of April 16, 1959, to you, relating to potential ore reserves on the subject property, and the results reported monthly since that date indicate that the project should be certified. However, we will reserve our decision on this matter until the final reports and recommendations relating to the project are received.

Memorandum

TO: Chairman, Operating Committee, OME

From: Executive Officer, OME Field Team, Region III

Subject: Docket No. DMEA 4568 (Molybdenum) Contract Idm-E1094
Molybdenum Corporation of America (Moly or Questa mine)
Taos County, New Mexico

Enclosed are the following pertaining to operations under the subject contract:

(1) Government and Audit copies of Amendment No. 4 which was forwarded by your memorandum of November 25, 1959, for signature by the Operator after supplying recording data for the Phyllis claims and execution of MME Form 52, Lien and Subordination Agreements.

(2) Two copies of project work approval issued by the OME Field Team, Region III, authorizing extension of the No. 3 Drift East.

It appears to be a foregoing conclusion that all the work provided for under the contract will not have been completed by June 30, 1960; therefore, the provisions of Item 3d of Amendment No. 4 would automatically become effective which constitutes Psuedo Certification of the project. Please advise as to whether or not we are correct in the above interpretation of the Amendment.

Dear Mr. Carman:

In reference to Item 10 of your letter dated October 20, 1959, Government approval of work is as follows:

Extend the No. 3 Drift East on a bearing of approximately N 80° E not to exceed 500 feet beginning at coordinate E 1300.

In reference to Item 9 of your letter of October 20, 1959, extension of the No. 1 Crosscut North, and in reference to your letter of December 7, 1959 requesting reconsideration of the matter, you will be advised at a later date as to the Government's decision.

Nothing in the above work approval shall be construed to increase the estimated total cost of the project, the aggregate amount which the Government may be required to contribute, nor the "Fixed Unit Cost" of any item of work.

Very truly yours,

OME Field Team, Region III

Dear Mr. Carman:

Reference is made to work request Item 9 of your letter of October 20, 1959, and your letter of December 7, 1959, requesting Government approval for extension of the No. 1 Crosscut North under the provisions of Contract Idm-X1094.

Government contribution to the costs of extending the No. 1 Crosscut North is not considered warranted at this time, at least not until more conclusive information is obtained relative to the trend of the more highly mineralized zone which has recently been encountered in the No. 3 Drift East being driven from the No. 1 Crosscut North at approximate coordinate N 2300; therefore, Government approval of the work request is denied at this time.

Possibly consideration should be given to diamond drilling ahead of the No. 1 Crosscut North, and drilling to the East to test for continuity and extent of the mineralized zone encountered in the No. 3 Drift East.

Very truly yours,

JWT:ltm

Memorandum

To: Executive Officer, OME Field Team, Region III
Through: J. William Ensler

From: R. U. King
T. M. Romslo

Subject: BMEA Docket 4968 (Molybdenum), Contract Idm-21094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico

The operator on December 9 restates his request of an earlier date to continue driving the No. 1 crosscut north to about coordinate 3100 north.

Strictly on geologic grounds, the operator's consulting geologist, Dr. R. H. Carpenter, makes a good case for continued exploration in a northerly direction. He points out that the Granite-Green Rock north-trending contact intersected in the No. 4 crosscut west is swinging toward the east, and therefore, continuation of the No. 1 crosscut should also cross the contact. Again if there is an easterly swing to the contact followed by a northerly swing, a northwestward-plunging trough would occur along the contact. That such structural conditions are favorable for mineral concentration is not doubted, but the exploration to date has discovered in these same geologic conditions an enormous volume of material containing 0.2 to 0.3 percent MoS_2. The assays of drift samples over the last several hundred feet do not indicate any significant increase in MoS_2 content over that already discovered. Also coordinate 3100 N could be reached by a 600-foot horizontal drill hole if such a target is considered to have merit.

The face of the No. 1 crosscut north has at this date passed underneath the zone of surface geochemical anomalies, and the grade of mineralization (0.2-0.3 percent MoS_2) is believed to be quite adequate to have furnished sufficient mineral to account for the anomalies (500 to 1,000 ppm).

One possibility remains: the mineralized zone reflected in the surface geochemical anomalies may dip northward reaching the level

(7,805 feet) north of the present face of the No. 1 crosscut north. If this is the situation, a horizontal hole due north should intersect the zone if it is within reasonable reach.

Continuation of crosscutting northward at this time is not recommended.

Subject: Docket No. DMEA 4568 (Molybdenum) Contract No. Idm-M1094
Molybdenum Corporation of America (Moly or Questa mine)
Taos County, New Mexico

Enclosed is a copy of the Operator's letter of December 9, 1959, with attached letter from Robert H. Carpenter to this Office dated December 7, 1959, containing comments and recommendations relative to extension of the No. 1 Crosscut North.

By letter of October 20, 1959, the Operator requested under Item 9 Government approval for the extension of the No. 1 Crosscut North from approximate coordinate North 2430 to North 2930. The memorandum dated November 4, 1959 from the field examiners regarding the Operator's work proposal of October 20, recommended that extension of the No. 1 Crosscut North under Item 9 be denied.

Please submit a joint memorandum containing your recommendations in reference to the Operator's request that the northerly extension of the No. 1 Crosscut North be reconsidered.

Mr. J. W. Townsend, Executive Officer
Office of Minerals Exploration, Region 3
Denver Federal Center, Building 25
Lakewood, Colorado

Dear Mr. Townsend:

You will find enclosed three copies of the geologic notes covering the October and November advance in No. 1 Crosscut North and No. 3 Drift East which are located in the northern part of the Questa mine exploration level.

This part of the mine appears to be resolving into a very favorable target area. The contact seems to be swinging to the east, it appears to be low angle to the west or northwest, and is quite irregular. Intrusive porphyries (red rock) and intruded andesitic rocks (green rock) occur alternately in both headings. A part of this irregularity can be attributed to initial irregularities in the intrusive contact and a part to post intrusive faulting. We may be entering the root zone or break through area of the porphyry plug and the northerly and easterly-trending dikes which occur directly above on the surface in the upper part of Sulphur and Iron Gulches. If the contact swings sharply to the east and thence northward, this break-through would be located in a northwesterly plunging trough in the porphyry contact.

Structurally, there is a distinct change in attitude of the faults. To the south, the fabric consists of northeast-trending veins with a southeast dip, of somewhat later northerly-trending faults with a west dip, and of still later northeast trending faults with a northwest dip. As illustrated on the accompanying sketch, the mineralized faults and fractures trend northwesterly to northerly and dip westward in No. 3 Drift East except for a strong north-south-striking vein which dips approximately 30 degrees to the east.

The frequency of appreciably higher grade zones of mineralization appears to be increasing in this area of the mine. This is indicated by an overlay of the assay map as well as by the strength and number of mineralized faults and fractures evident underground.

It is my recommendation to the Company that No. 1 Crosscut North be driven northward to Coordinate 3100 North in order to close off the geologic relationships on the western side of the proposed target area. It is entirely possible that westerly-trending dikes and structures on the surface will be in evidence in this northerly extension of No. 1 XCN, and that appreciable mineralization will be related to such structures. In any case, certainly, this work will yield very valuable geologic data vital in the interpretation of the geologic features within the target area.

(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

Included in our application of October 20th is Item 9, Drifting North in Crosscut No. 1 North.

Dr. Carpenter, our geologist, has prepared a geological sketch of this area and a letter giving his interpretation of the geological significance with respect to molybdenite mineralization in this area and his recommendation that this drifting be approved.

We are enclosing six copies of the sketch and letter which we hope will better inform you of the reasonableness of our request.

In regard to the release from Dotson Minerals Corporation and the record of Phyllis Claims 5 and 7, we expect to get this information to you within the next day or so.

Yours very truly,

It is my understanding that the present face of No. 1 XCN is approximately in the position deemed desirable under the initial D. M. E. A. recommendations of the Project. Since that time, much critical geologic information has been secured on the surface and underground related to the area now being explored by No. 3 Drift East. It is my opinion that in order to wind up the O. M. E. work under the Questa project, it is very desirable that financial support be given to an extension of No. 1 Crosscut North to Coordinate 3100 North. Diamond Drilling will not give attitudes and detailed relationships of faults, veins, fractures, and rock types critical to an analysis of the geology in the target area. It is my sincere hope that you will recommend O. M. E. support to the extension of No. 1 XCN in order to round out the project in this part of the mine.

If there is further information which you wish to have please call on me.

Very sincerely,

Robert H. Carpenter

Dear Mr. Carman:

Now that executed MMC Form 52 Lien and Subordination Agreements have been provided, also recording data for the Phyllis No. 5 and 7 claims; therefore, proposed Amendment No. 4 to Contract Idm-E1094 can be released for execution. Enclosed are the Government's, Audit, Finance Office and Field Team copies for that purpose.

If the proposed amendment is satisfactory, all copies are to be signed by an official of Molybdenum Corporation of America authorized to sign such an instrument, the signer's title inserted, the corporate seal affixed, and all copies promptly returned to this office.

Upon return of the executed copies of the amendment, the Operator's copy of the amendment and confirmation of approval extending the No. 3 drift easterly will be forwarded to you.

Very truly yours,

Memorandum

TO: J. W. Townsend, Executive Officer, GME Field Team, Region III

From: T. M. Romslo

Subject: Docket No. 4568 (Molybdenum) Contract Idm-E1094, Molybdenum Corporation of America (Moly or Questa mine) Taos County, New Mexico

A zone of relatively high grade ore was cut during November 1959 by No. 3 Drift East which is being driven from No. 1 Crosscut North. The zone is localized by a northerly trending dike of a fine-grained, siliceous rock, probably felsite, that dips about 45 degrees west. Molybdenite is mainly concentrated in a 15-foot wide zone along the hanging wall of the dike where it is closely associated with quartz veinlets in transition rock. It also occurs in the dike rock as a filling of weak fractures. The foot wall of the 30- to 40- foot wide dike is in fault contact with essentially barren greenstone.

Assays of samples from the mineralized zone had not been completed when I visited the mine December 3, 1959. However, the grade is indicated by the assays of samples taken from 29 4-ton truck loads of the ore which has been stockpiled at the mill. The MoS_2 content of the approximately 120 tons of ore ranged from 1.5 percent to 4.5 percent and averaged about 2.2 percent.

From: Chairman, Operating Committee, OME

Subject: Docket No. DMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract No. Idm-E1094

Enclosed are the original and four copies of a proposed Amendment No. 4 (3 pages) to the subject contract, signed by the Acting Director for the Government. Also enclosed are two extra copies for Field Team use, and the original and four copies of the Lien and Subordination Agreements mentioned in the amendment.

After the agreements are properly executed by Dotson Minerals Corporation and attached to their respective copies of the amendment, if you and the Operator find the proposed amendment in order, please have an authorized representative of the corporation sign the original and four copies. Thereafter, kindly distribute the copies in the usual manner.

This amendment has been prepared in accordance with the recommendations submitted with your memorandum of November 9, 1959. However, we recommend that the Field Team authorize the Operator to drive the No. 3E crosscut from the N. drift only 500 feet (to coordinates 2325N - 1810E) at this time. Additional drilling from the end of the crosscut should be sufficient to explore this area and could probably be completed before June 30, 1960, the termination date of the contract, as amended.

Please insert recording data for Phyllis claims in the amendment.

DRAFT
11/16/59
FMMurphy/gla

EXPLORATION PROJECT CONTRACT
MOLYBDENUM CORPORATION OF AMERICA
DOCKET NO. DMEA-4568

AMENDMENT NO. 4

It is agreed this _____ day of _____, 1959, between the United States of America, acting through the Office of Minerals Exploration, hereinafter called the Government, and Molybdenum Corporation of America, hereinafter called the Contractor, that Exploration Project Contract No. Idm-E1094 (Docket No. DMEA-4568), dated May 31, 1957, as amended, is further amended, effective November 1, 1959, as follows:

1. The date fixed in Arti le 1 (a) of the contract for completion of the work is extended from 30 months to 37 months.

2. In Annex II, Item (b) is changed to read as follows: In Article 6 (b) of the contract the period "15 years" is changed to "16 years."

3. It is the essence of this Contract that the work be completed on or before June 30, 1960, in the manner required by the Contract, and if it is not so completed, the following provisions shall thereupon become effective:

(a) The Contract and all obligations of the parties thereunder, except as otherwise herein provided, shall be and are hereby termined.

(b) The Government will contribute only to the allowable costs incurred prior to June 30, 1960, except the costs for assays of samples shipped to laboratories on or prior to that date, which may be billed subsequently.

(c) The Operator shall promptly perform all winding-up and settlement actions provided for in the Contract, including the rendering of a final report and final account.

(d) The Operator, as principal if the Operator is the producer, or as surety if the Operator is not the producer (for example, if the Operator either transfers or fails to retain its interest in the land), shall pay to the Government the royalty on production provided for in the Contract, (as amended herein), as if certification of discovery or development had been made, such certification being hereby waived by the Operator. In addition, all rights of the Government provided for in the Contract with respect to a certification of discovery or development, percentage royalty and liens to secure payment thereof, reports (including preservation of the Operator's records), accounts, audits, and the right to recover any overpayments are hereby preserved.

(e) The Operator hereby agrees to save the Government harmless from all claims or demands under or arising out of the Contract, except as otherwise provided by this amendment.

4. In Annex I of the Contract the following claims are added:

Buena Vista Nos. 1, 2, 3, 4, 6, and 7, Torber No. 2, and Renegade, situate in secs. 25, 35, and 36, T. 29 N., R. 13 E., Red River Mining District, Taos County, New Mexico. The claims are as shown by U. S. Mineral Survey No. 1943, and as described in U. S. Patent No. 1013380, dated March 10, 1928.

The approximate locations of the above-mentioned claims with reference to the other claims mentioned in Annex I are shown on the claim map attached to and described in Amendment No. 3 to the Contract, and made part hereof by reference. These claims are in Area A of the project area as described by the terms of the Contract.

The Operator has rights of possession of the above-named claims under the terms of a "Warranty Deed," dated October 15, 1959, by Dotson Minerals Corporation, which is recorded in Book A-58, pages 391-392, in the official records of Taos County, New Mexico.

A Lien and Subordination Agreement covering the claims, executed by Dotson Minerals Corporation, is attached hereto and made part hereof.

This amendment shall not be construed to increase the estimated total cost of the project, the aggregate total amount which the Government may be required to contribute, or the fixed unit cost of any item of work.

Executed in quintuplicate the date and year first above written.

AIR MAIL

Memorandum

TO: Chairman, Operating Committee, OME

From: OME Field Team, Region III

Subject: Docket No. DMEA ~~4468~~ 4568 (Molybdenum) Contract Idm-E1094
Molybdenum Corporation of America (Moly or Questa mine)
Taos County, New Mexico

Reference is made to the Operator's letters of October 20 and October 30, 1959, with attached data which were forwarded to you by copy of memoranda from this office to the field examiners dated October 26 and November 3, 1959. Enclosed are the following in conjunction with the matter:

1. The original and two copies of a joint memorandum dated November 4, 1959 from R. U. King and J. W. Hasler, Geologists, Geological Survey, and T. M. Romslo, Mining Engineer, Bureau of Mines.

2. Two copies of the Field Team's approval for the drilling of 4 holes from the No. 4 drift westerly off of the No. 1 Crosscut North.

You will note in the work approval that the Operator's work requests, Items 5-8, inclusive, were denied and that there was a change in the attitude of 2 of the 4 approved holes from that requested by the Operator.

Final action regarding the work approval requested under Items 9 and 10 is contingent on the execution of an amendment to the contract to extend the presently established completion date, and to include under Article 2 and Annex 1 of the contract the additional claims listed by the Operator. The claims are shown on the map attached to the Operator's letter of October 20.

The field examiners recommend denial for the northerly extension of the No. 1 Crosscut North under the Operator's Item 9, but recommend the driving of 1,000 ft. of drift easterly from the No. 1 Crosscut North. The drifting easterly was also recommended by the field examiners in their memorandum of May 14, 1959, which was in conjunction with Amendment No. 3. The Operator did not hold possession of the land involved at that time; therefore, the drifting easterly could not be approved along with the drifting westerly.

1/ As of Oct 1. 1959 - 2595 feet of the drifting and crosscutting allowed under the contract have not been used.

To further extend the completion date is a matter of policy that can only be resolved at the Washington level; however, this office concurs in the belief of the field examiners that exploration to the east of the No. 1 Crosscut North is desirable in order to round out the exploration program; therefore, it is recommended that an appropriate amendment be prepared to extend the completion date to June 30, 1960, as requested by the Operator, and to include the additional claims under Article 2 of the contract.

Memorandum

To: Executive Officer, OME Field Team, Region III

From: R. U. King
J. W. Hasler
T. M. Romslo

Subject: Request for approval of additional diamond drilling and drifting. DMEA Docket 4568 (Molybdenum), Contract Idm-E1094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico

The operator, in a request dated October 20, 1959, made application for approval of additional diamond drilling and drifting under the subject contract. A detailed study and review of the request has been made and resulted in the following recommendations and conclusions.

A list of 10 items was requested. Items 1 through 8 constitute diamond drilling totalling an estimated 6,400 feet, and items 9 and 10 constitute crosscutting totalling an estimated 1,000 feet. The drilling and drifting are designed to test the porphyry-green rock contact as well as other ground thought to be favorable for discovering additional molybdenum-bearing material.

Items 1 through 5, comprised of diamond drill holes number 37 through 41, are located in the northeast portion of the Questa mine on the 2nd Tunnel Shaft level in and adjacent to the No. 1 Crosscut North, and constitute drilling anticipated when the approved Drift No. 4 West from the No. 1 Crosscut North was completed. Drift No. 4 West penetrated the porphyry-green rock contact at the 430 E coordinate.

Assays from diamond drill holes number 34 and 36 and from wall samples are high enough in grade to warrant additional drilling in the area. The area in general will average better than 0.20 percent MoS_2.

Item No. 1, proposed drill hole No. 37, is designed to test the continuity of the contact above the drift. The examining team, however, thinks that DD Hole No. 37 should be drilled vertically downward

rather than vertically upward since two previously completed holes (Nos. 34 and 36) penetrated the porphyry-green rock contact farther southeast on the No. 1 Crosscut North from 350 to 390 feet above the level. A hole drilled vertically downward in the vicinity of proposed hole No. 37 would give an additional thickness to the deposit as no work has been done below the 2nd Tunnel Shaft level in this area. It is therefore recommended that DD hole No. 37 be drilled downward -90° rather than as proposed by the applicant.

Proposed item No. 2, diamond drill hole No. 38, is designed to test the area northward from coordinate 1830 N, 630 E. It is recommended that the hole be drilled as proposed by the applicant (due north at 0°).

Item No. 3, proposed diamond drill hole No. 39, at coordinates 1720 N., 60 E, is designed to test the contact 800 feet below Drift No. 4 West. It is recommended that hole No. 39 be drilled at -90°, as proposed by the applicant, as this hole will again test the area below the 2nd Tunnel Shaft level, heretofore unexplored.

Item No. 4, proposed diamond drill hole No. 40 located at coordinates 1720 N, 60 east, is designed to penetrate ground northward for 800 feet at an angle of a minus 45 degrees. The examining team recommends that this hole be drilled as a horizontal hole, as the ground explored between a -90° hole and a -45° hole from the same station would not explore enough virgin ground in this type of a disseminated deposit.

Item No. 5, proposed diamond drill hole No. 41 at coordinates 1720 N 60 E, is designed to explore westward (S 82° W) from the face of Drift No. 4 West off the No. 1 Crosscut North. Analyses of samples taken along the drift show the last 200 feet to assay 0.18 percent MoS_2. Proposed hole No. 41 would explore ground within 800 feet of surface hole 11-A and would also explore beyond the favorable area circumscribed by the geochemical work on the surface. It is therefore recommended that Hole 41 be denied, or at least be held in abeyance pending results of proposed holes 39 and 40.

Item No. 6, proposed diamond drill hole No. 42 in the No. 7 Crosscut North, is designed to penetrate the porphyry-green rock contact at depth. The porphyry-green rock contact should have been cut by the No. 7 Crosscut North if the contact dipped eastward, but since the contact has not been found in this crosscut the contact must dip in a westerly direction, and hole 42 could not reach its objective. It is therefore recommended that item 6, hole 42, be denied.

Item No. 7, proposed diamond drill hole No. 43, is designed to reach the porphyry-green rock contact at depth below the No. 7 Crosscut North. The denial of this hole is recommended for the same reason as the previously proposed hole No. 42.

Item No. 8, proposed diamond drill hole No. 44, is designed, by the applicant, to test an area north of the present face of the No. 7 Crosscut North. Sampling along the No. 7 Crosscut North shows that MoS_2 of the 2nd Tunnel Shaft level, assayed less than 0.10 percent MoS_2. The geochemical anomaly map shows this western area to be less favorable than the eastern area, and exploration this near the surface (less than 900 feet) is not good, as indicated by exposures of country rock and only low-grade mineralization in Goat Hill gulch.

It is proposed therefore that item 8, diamond drill hole No. 44, be denied, and that the equivalent footage be used to further test the favorable area in the vicinity of diamond drill holes 30 and 27 in No. 4 Crosscut South and hole No. 22 in No. 5 Crosscut South. These three holes penetrated from a 400- to 600-foot thickness of mineralized material averaging about 0.4 percent MoS_2 (present day ore grade and better than most of the material discovered to date).

Items 9 and 10 constitute proposed drifting north and east from the No. 1 Crosscut North to test favorable ground in the northeast portion of the property. These two drifts must have additional ground subordinated under the contract as well as extension of contract termination date should they be approved as proposed by the applicant.

Item 9 is a drift proposed to explore ground north (N 7° W) from the present face of the No. 1 Crosscut North. An appraisal of this work shows that the present drift has passed under the most favorable area shown on the geochemical map, and that any further work may penetrate less favorable ground. It is proposed that Item No. 9 be denied, and that equivalent footage be used under proposed Item No. 10.

Item No. 10 is a proposed drift to explore eastward into favorable ground toward the old mine workings, and under the most favorable area indicated by the chemical work. It is recommended that a drift be driven in this direction (N 83° E) for 1,000 feet rather than the proposed 500 feet. This unit of exploration should not be approved, however, unless the contract termination date is extended. The operator could not possibly complete the work unit within the remaining two months of life in the contract. The drifting under item 10 is recommended only in anticipation of subsequent complimentary drilling from the new openings. If an extension is not granted, a drill hole (N 82° E. 0°) should be substituted for the 1,000 feet of drifting.

The examining team feels that exploration to the east of the No. 1 Crosscut North, under the favorable area indicated by the geochemical work and by exploration in the vicinity of drill hole 30,

is needed to complete and round out the exploration program and to fulfill the objectives of the contract; and therefore it is recommended that extension of the contract termination date be seriously considered.

Mr. J. E. Carman
Molybdenum Corporation of America
Urad Mine
Questa, Colorado

Re: Docket No. DMEA 4765 (Molybdenum)
Contract No. Ilm-8109A
Molybdenum Corporation of America
(Moly or Questa mine)
Taos County, New Mexico

Dear Mr. Carman:

Reference is made to your letters dated October 20 and October 30, 1959, with attached data which constitutes your request for the Government's approval for 10 items of work, and preparation of an amendment to the contract which would include additional land to that substituted under Article 2, and extend the completion date in Article 1 to June 30, 1960. Government approval is granted for the drilling of 4 holes as follows. Item numbers correspond to the item numbers of your request:

Item	Hole No.	Approximate Coordinate Location of Hole		Inclination	Bearing	Depth**
1	37	1850 N	650 E	-90°*	0	800 ft.
2	38	1850 N	650 E	0°	N	500 ft.
3	39	1780 N	650 E	-90°	0	800 ft.
4	40	1780 N	650 E	0°*	N	800 ft.

Note-*: Hole 37 changed from requested plus 90° to minus 90°. Hole 40 changed from requested minus 45° to horizontal.

** Approval of holes 37, 38, 39 and 40 is further qualified to the extent that the holes may be continued to the stated depths or within practicable limits provided drill samples contain visible MoS2 estimated to be in excess of 0.20 percent. The exception is hole No. 38 which is limited to a maximum of 500 ft.

There follows Government action on work items 5-10, inclusive:

Item No. 5, hole No. 41, Government participation in the costs of drilling the hole denied because it is considered that results of the hole would not add materially to present knowledge of the deposit. In addition, company surface hole 11A has roughly indicated the grade of mineralization in the objective area.

Item No. 6, hole No. 42, Government participation in the costs of drilling the hole denied because it is believed that the proposed hole would not reach the planned objective of the porphyry-green rock contact, and otherwise would not add materially to present knowledge of the deposit.

Item No. 7, hole No. 43, Government participation in the costs of drilling the hole denied for the same reason as the basis for denial of hole No. 42, Item No. 6.

Item No. 8, hole No. 44, Government participation in the costs of drilling the hole denied on the same basis as denial of hole No. 41, Item No. 5.

Item No. 9, drifting northerly from the end of the No. 1 Crosscut North and Item No. 10, drifting southerly from the No. 1 Crosscut North. Action regarding the proposed drifting under Items Nos. 9 and 10 is deferred because approval is contingent on the execution of an amendment to the contract to extend the date presently fixed for completion of the work and to include additional land to that presently subcontracted under Article 2 of the contract as described in Annex I, and amendments thereto. Preparation of an amendment of the nature involved is not within the authority delegated to this office; therefore, the materials being referred to the Washington Office, OME, for their consideration and appropriate action on which you will be advised as soon as this office is informed.

All of the above approved work is to be performed in conformance with all provisions in the contract pertaining thereto. The Government will not contribute to the costs of a hole which has not been completed to its objective, by the date fixed for completion of all work under the contract.

Nothing in the foregoing work approval shall be construed to increase the total estimated cost of the project, the aggregate amount which the Government may be required to contribute, nor the fixed unit cost of any item of work.

Very truly yours,

OME Field Team, Region III

Taos County, New Mexico

Dear Mr. Townsend:

Supplementing our application of October 20, 1959 asking for additional work under the contract, we anticipate you may require verification of ownership of property recently purchased.

In this group of claims are: Buena Vista 1, 4, 6 &7, Renegade and Torbert No. 2 which we asked to be subordinated in our application.

We are therefore enclosing copies of the following documents, all on file in the Taos County Clerk's office, Taos, New Mexico.

AGREEMENT OF SALE OF MINING CLAIMS

WARRANTY DEED

MORTGAGE

We will appreciate your advising us, as soon as convenient, any additional information that may be necessary for the consideration of our application.

Yours very truly,

MOLYBDENUM CORPORATION OF AMERICA

Re: Docket No. DMEA 4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

We are herewith making application for the following drifting and drilling, all on the 2nd Tunnel Shaft Level:

DRILLING

ITEM	HOLE NO.	LOCATION	APPROX. COORDINATES		INCLINATION	BEARING	MAX DEPTH
(1)	37	Cx #1 N Dft #4 W	1830 N	630 E	plus 90°	0	800 ft**
(2)	38	" "	1830 N	630 E	0°	N	800 ft
(3)	39	" "	1720 N	60 E	-90°	0	800 ft
(4)	40*	" "	1720 N	60 E	-45°*	N	800 ft
(5)	41	" "	1720 N	60 E	0°	S 82 W	800 ft
(6)	42	Cx #7 N	510 N	1630 W	-90°	0	800 ft
(7)	43	Cx #7 N	740 N	1890 W	-90°	0	800 ft
(8)	44	Cx #7 N	950 N	1860 W	0°	N	800 ft

*Note: Subject to change to flatter inclination pending results from Hole #39.
** Probable average depth: 500 feet.

DRIFTING

ITEM	LOCATION	APPROXIMATE COORDINATES Beginning	Ending	DISTANCE	BEARING
(9)	Cx #1 N	2430 N - 980 E	2930 N - 920 E	500 ft.	N 7° W
(10)	Cx #1 N Dft #3 E	2265 N -1315 E	2325 N - 1810 E	500 ft.	N 83° E

Items (1) through (5) cover the drilling program anticipated when approval of Drift #4 W was given. Drift #4 W was in granite porphyry until the drift crosses coordinate about 430 E, hence Hole #37, Item (1) is inclined at plus 90 degrees seeking the contact.

Hole #38, Item (2), a horizontal hole north has the objective of probing under what could be a west dipping and striking "nose" of granite porphyry with the possibility of reaching a north dipping contact on the north side of the granite "nose".

Hole #39, Item (3) in green rock is on the west side of what is designated as a fault contact, thus it is a -90° hole seeking the contact.

October 20, 1959

Mr. J. W. Townsend
Executive Officer, O.M.E.
Field Team, Region III
Federal Center, Denver, Colo.

Re: Docket No. DMEA 4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America

Hole #40, Item (4) is planned to determine the contact position to the north and below. Its inclination is tentatively put at -45°. After determining the contact location by Hole #39, it may be desirable to change the inclination of this hole.

Hole #41, Item (5) should determine the structure to the west. Block faulting may have occurred in the area, thus this hole could again enter granite porphyry. Faulting could well have altered the relative positions of the drift and the contact with consequent effect on mineralization.

Hole #42, Item (6) would depend upon the results obtained in Hole #33 some 400 feet to the south east off crosscut #7 N. Holes #31 and #32 further to the south east did not reach the granite contact as both entered a green mud after leaving the porphyry. It became impossible to drill through this mud and both holes had to be abandoned at about 500 feet below the level.

Hole #43, Item (7) has the contact as the objective.

Hole #44, Item (8) to the north will probe an area the surface geology of which, both as to structure and alteration, appears favorable.

Relative to Items (9) and (10), Cx No. 1 N and Cx No. 1 N Drift #3 E the beginning coordinates are estimated as the location of these workings on December 1st when we might expect ratification of this application.

Work in Cx #1 N Dft #3 E was resumed about October 15th and in Cx #1 N is scheduled to be resumed November 1st after having been discontinued due to entering or approaching claims purchased on February 17, 1959, the title of which was not cleared until October 16, 1959.

Work in No. 1 Crosscut North was in progress when the D.M.E.A. contract started in June, 1957. It has been driven some 2400 feet, all without government assistance. At about coordinate 1400 N, average assays began to improve, at first, about doubling over the previous several hundred feet; then at 1850 N showing some comparative highs. From approximately 2100 N to the breast at 2300 N several high assays brought the average of about the last 200 feet of drift up to 0.42% MoS_2 making this a new and most significant discovery. In fact, this is the best showing so far opened.

Work under Item (9) would determine structure and values to the north. Contact contours, it is speculated could turn north east thus giving a north east strike with a north west dip to the contact. This is a similar situation to that found in the old mine to the south where a southeast contact strike was determined dipping to the southwest.

October 20, 1959

Mr. J. W. Townsend
Executive Officer, O.M.E.
Field Team, Region III
Federal Center, Denver, Colo.

Re: Docket No. DMEA 4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America

Item (10), would be pursuing to the east the discovery in the north crosscut.

For all of the work herein requested additional claims will be necessary. We therefore ask that the following be subordinated under the contract:

Summit #10 and #11 to cover work requested in Items (7) and (8).
Buena Vista #4 and #7 and Summit #6 to cover work requested in Item (9).
Renegade, Phyllis #5 and #7, Lonesome #1, Torbert #2, Buena Vista #1 and #6, to cover work requested in Item (10). Items (1) through (6) are on subordinated claims.

In order to complete the work above requested additional time will be required under the contract which expires January 15, 1960.

It is desirable from the standpoint of keeping No. 7 Crosscut open and ventilated that drilling be first done here, Items (6) to (8), where three holes are scheduled in addition to Hole #33 which should be completed November 1st, 1959. Then the program would be to drill holes Items (1) to (5). Reviewing the time required per hole and average depth of hole, it is found that during the time Boyles Bros. has been drilling since January, 1959, the average feet per day drilled in the mine has been 26.2 and the average depth of hole has been 564.6 feet, thus on the basis of 25 two-shift working days per month, a hole will be drilled in .862 months. For 8 holes, it will require therefore 6.9 months.

As drifting has been proceeding at a 400 ft. per month rate, 2½ months from December 1st should complete Items (9) and (10). This would allow time for additional drilling in these drifts. With the drifting finished, drilling could be expedited.

During the past year due to conditions imposed under the contract we have been unable to expedite the drilling by putting on another drill. Also due to the title difficulty we were unable to exploit the area under Items (9) and (10) and in this area we have, from present data a most important discovery, not contemplated when the contract was made.

We therefore ask that the contract be extended to June 30, 1960.

Yours very truly,

MOLYBDENUM CORPORATION OF AMERICA

Re: Docket No. ~~RMKA~~ 4568 (Molybdenum)
Contract No. ~~Km~~-K1094
Molybdenum Corporation of America
(Moly or Questa mine)
Taos County, New Mexico

Dear Mr. Carman:

In reference to your two letters dated August 25 and August 27, 1959, this constitutes Government approval for work under the contract as follows:

(1) Confirmation of verbal approval given August 26, 1959 for 100 ft. extension of the drift westerly from Crosscut No. 1 North.

(2) Approval to extend the drift westerly from Crosscut No. 1 North an additional 400 ft., or to a point not to exceed 1000 ft. from the point of beginning of the westerly drift at Crosscut No. 1 North.

(3) Drill holes Nos. 32 and 33 from points in the No. 7 Crosscut North at the following approximate locations and attitudes:

Hole No.	Coordinate Location	Inclination	Depth
32	S200 - W970	- 90°	1/
33	N100 - W1270	- 90°	1/

1/ Holes may be continued to a depth of 800 ft. or within practicable limits as long as drill samples contain visible MoS_2 estimated to be in excess of 0.20 percent.

All of the above approved work is to be performed in conformance with provisions in the contract pertaining thereto.

Nothing in the foregoing work approval shall be construed to increase the total estimated cost of the project, the aggregate amount which the Government may be required to contribute, nor the "Fixed Unit Cost" of any item of work.

Memorandum

To: Executive Officer, OME Field Team, Region III

From: J. W. Hasler
T. M. Romslo

Subject: Recommendation for reinstatement of two prior requested holes as well as approval for 500 feet of additional drifting westward from No. 1 crosscut north. DMEA Docket 4568 (Molybdenum) Contract I6m-E 1094, Molybdenum Corporation of America, Questa mine, Taos County, New Mexico

The applicant requested reinstatement of two diamond drill holes that were originally requested in a letter with attached map dated May 18, 1959, and were subsequently denied due to lack of sufficient data. The holes were Nos. 32 and 33 located in the No. 7 XCM some distance from diamond drill holes 30 and 31 in the No. 4 crosscut tunnel south and the main crosscut tunnel west, respectively.

The applicant also requested approval for an additional 500 feet of drifting S 82° W in the No. 4 crosscut west from the No. 1 crosscut north.

A field inspection was made by an OME examining team September 9, 1959.

Diamond drill hole No. 31 was drilled vertically downward at the junction of the 200 Level Second tunnel west drift and the No. 7 crosscut north. Granite was reportedly cut 10 feet below the drift; however, a transition (operator's terminology) zone continues to about 150 feet. Sludge samples averaged 0.21 percent MoS_2 for the first 260 feet.

Diamond drill hole No. 30 in the No. 4 crosscut south reached a depth of 800 feet. Assays from the hole ranged from 0.10 percent to 1.65 percent MoS_2 and averaged 0.20 percent MoS_2. The granite was penetrated at 100 feet below the drift.

It is recommended that upon the strength of assays in diamond drill hole Nos. 30 and 31, as well as upon the knowledge of Green rock-granite contact, request for diamond drill holes Nos. 32 and 33 in the No. 7 crosscut north be reinstated and that both holes be completed.

The operator in a letter dated August 25, 1959, requested an additional 500 feet in the No. 4 drift west from the No. 1 crosscut north as he has completed the first 500 feet. The drift is in fractured granite porphyry, and samples taken assayed from 0.07 percent MoS_2 to 2.89 percent MoS_2 and averaged at least 0.20 percent MoS_2.

It is recommended that the additional 500 feet of drifting westward as requested by the applicant be approved because of the favorability of the granite porphyry. Verbal approval was given the operator August 26, 1959, for the first 100 feet, and the balance of 400 feet was to be approved or disapproved pending a field examination which was made September 9, 1959, as previously mentioned.

Re: Docket No. D.M.E.A. 4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

We wish to reinstate our request of May 18th to drill holes No. 32 and No. 33 in Crosscut No. 7 North. Request on these holes was withheld in your letter of July 9th.

2nd LEVEL DRIFT WEST CROSSCUT NO. 7 NORTH

Hole No.	Bearing	Inclination	Coordinate
32	0	- 90°	S 200 - W 970
33	0	- 90°	N 100 - W 1270

Our objective in drilling these holes is to further explore the granite or granite porphyry contact supposedly underlying the transition rock of the No. 7 Crosscut to the east of the Goat Hill porphyry. Hole No. 31, the log of which you have, was stopped in very broken porphyry at 500 feet after having passed through 150 feet of transition rock, 100 feet of granite and 250 feet of porphyry. Deeper drilling in holes 32 and 33 seeking a granite contact may be found necessary.

We consider downward exploration necessary as part of the exploration of this area, not only as to mineralization but as to formation.

Yours very truly,

Re: Docket No. D.M.E.A. 4568 (Molybdenum)
Contract No. Idm-E1094
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico

Dear Mr. Townsend:

As the 500 feet of approved work in the west drift off of Crosscut No. 1 North will probably be completed August 29th, we are asking approval of an additional 500 feet.

This drift started from Crosscut No. 1 North of the second level at approximately 1850 N and was driven S 82° W. We wish approval to continue it 500 feet in the same direction approximately to coordinates 1725 N and 65 E.

This drift as you will note from our July "104" report was in granite porphyry during that month and has so continued up to date. Recently, there have been some small inclusions of "green rock" in the porphyry. According to the chip samples to the end of July and the car samples since that time, the first 80 feet averaged 0.40% MoS_2. The balance of the drift in the porphyry has run consistently 0.16% MoS_2 with no trend in mineralization evident.

Extending this drift should cross the contact at this level. It would allow vertical drilling for contact determination as well as drilling to the north to explore that area. For information in this regard refer to Dr. Carpenter's report with our letter of April 23, 1959.

Incidentally, we drilled Hole No. 36 to 390 feet and abandoned it due to squeezing ground. It was in porphyry to 380 feet and supposedly reached the contact at that point. The last 10 feet was in mud, thought to be transition material. Sludge assays averaged 0.22% MoS_2.

We trust our request will be approved.

Yours very truly,

Molybdenum Corp. of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Sir:

We ask you herewith for approval to stop drill hole No. 34. It was drilled AX.

We were in Porphyry to 330 feet, then hit the contact and drilled 7 more feet in a very soft mud. This soft material would squeeze so bad we couldn't get the rods back to the bottom of the hole. Therefore, we had to quit drilling in this hole at 337 feet.

Yours very truly,

Re: Docket DMEA 4568 (Molybdenum)
Contract Idm-E1094
Molybdenum Corporation of America
(Moly or Questa mine)
Taos County, New Mexico

Dear Mr. Carman:

Reference is made to your letters of April 23, May 18, and June 9, 1959, wherein you request Government approval for certain additional drifting, crosscutting, and diamond drilling. Government action in the matter is as follows:

1. Approval is withheld for extending the No. 7 Crosscut North in a northwesterly direction.

2. Approval is withheld for the drilling of diamond drill holes Nos. 32 and 33 from points in the No. 7 Crosscut North.

3. Approval is denied for the drilling of diamond drill hole No. 5 from a point in the No. 1 Crosscut North because of too close spacing to other holes.

4. Approval is granted to drift not to exceed a distance of 500 feet approximately S. 82° west from a point in the No. 1 Crosscut North at approximate coordinate 1850 N.

5. Approval is granted to drill two diamond drill holes from points in the No. 1 Crosscut North as follows:

Hole No.	Approximate Coordinate location of collar	Inclination
34	N 1400 - E1100	∠ 90°
36	N 1840 - E1040	∠ 90°

The work approved under items 4 and 5 above is to be performed in compliance with all provisions in the contract pertaining thereto.

Nothing in the foregoing work approval shall be construed to increase the total estimated cost of the project, the aggregate amount which the Government may be required to contribute, nor the fixed unit cost of any item of work.

Very truly yours,

OME Field Team, Region III

J. W. Townsend

July 7, 1959

Memorandum

To: Executive Officer, OME Field Team, Region III

From: E. N. Harshman

Subject: DMEA Docket 4568 (Molybdenum), Contract Ida-2 1094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico

With reference to the operator's requests of April 30 and June 9, 1959, for extending the No. 7 crosscut north and drifting westerly from the No. 1 crosscut north, the field examiners recommend as follows:

1. Deny the request to extend the No. 7 crosscut north pending completion of drilling from the workstumpt workings and a thorough review of the results of that drilling.

2. Approve the request for drifting approximately S 82° west from approximate coordinate E 1890 in the No. 1 crosscut north. At this time approval should be limited to drifting 500 feet southwesterly; additional drifting, if warranted, may be recommended after completion of the first 500 feet. Drilling to explore laterally from the recommended crosscut is contemplated.

The project was examined on June 3, 1959, at which time the No. 1 crosscut north had been extended to about coordinate 2350 North. The recommendation to drift southwesterly at coordinate 1850 North, in contrast to a previous recommendation for drifting at coordinate 2000 North, was based on the field examination.

I concur with above recommendations.

Memorandum

To: Executive Officer, OME Field Team, Region III
Through: E. N. Harshman

From: Robert U. King

Subject: Docket MMA 4568 (Molybdenum), Contract IAm-2 1094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico

In a letter dated May 18, 1959, the operator requested approval to drill the following holes:

A. No. 32, -90°, approx. S 800, W 970, in the No. 7 X-cut N; and No. 33, -90°, approx. N 100, W 1270 also in the No. 7 X-cut N. The objective of these holes is to explore the Goat Hill Porphyry contact which is expected to underlie the crosscut.

B. No. 34, +90°, approx. N 1400, E 1140, No. 1 X-cut N; No. 35, N 65° E, +49°, approx. N 1600, E 1110, No. 1 X-cut N; and No. 36, +90°, approx. N 1840, E 1040, No. 1 X-cut N. The objective of these holes is to explore the Granite-Green rock contact above the level.

A. Holes 32 and 33 cannot be recommended at this time because results of drilling to date have not indicated the probability that the Goat Hill porphyry contact dips eastward under the No. 7 X-cut N. The fact that the X-cut has not yet (6-1-59) encountered the porphyry indicates the contact has a very steep eastward dip of at least 65°. Consequently, vertical down holes would tend to parallel rather than crosscut such a structure.

Furthermore, little evidence has been presented to indicate any significant relations of the Porphyry-Green rock contact to better than average (0.2 percent MoS_2) mineralization.

Finally, exploration from the No. 7 X-cut north logically should follow completion of the currently approved hole No. 31 which is to be drilled from the juncture of the West drift and the No. 7 X-cut N.

B. It is recommended that holes 34 and 36 be approved but that the intervening proposed hole, No. 35, be denied, at least at its proposed inclination and bearing. Drilling at much less than 500-foot centers is not warranted in view of the very uniform character of mineralization indicated to date. A horizontal hole easterly or westerly or a down hole from the proposed location would not be unreasonable and could be recommended if requested by the operator.

Dear Mr. Carman:

Enclosed are the Government's, Audit, Finance Office, and Field Team copies of proposed Amendment No. 3 to Contract Idm-E1094, which has been prepared to provide for Stage II drilling and drifting in Area A as well as Area B, and to include the Summit Claims Nos. 4, 5, 7, 8, and 16 under the provisions of Article 2 of the contract.

If the Amendment is satisfactory, all copies are to be signed by an official of the Molybdenum Corporation of America authorized to sign such an instrument, the signer's title inserted, the corporate seal affixed, and all copies promptly returned to this office.

If the Amendment is not satisfactory, all copies are to be promptly returned to this office together with your comments on or objectives to the Amendment.

If the Amendment is returned properly executed, the Operator's copy will be forwarded to you together with Government approval for drifting and drilling from the No. 1 crosscut north.

Very truly yours,

June 10, 1959

Memorandum

TO: Chairman, Operating Committee, OME

From: Executive Officer, OME Field Team, Region III

Subject: Docket No. DMEA 4568 (Molybdenum) Contract No. Idm-E1094, Molybdenum Corporation of America (Moly or Questa Mine) Taos County, New Mexico

In reference to your letter of May 29, 1959, enclosed are five copies of a map submitted by the Operator which shows the Crosscut No. 1 north, the proposed drift to the west, and the additional claims to be subordinated, also enclosed are the original and one copy of the Operator's letter of June 9, 1959, by which the maps were transmitted to this office.

The Operator requested approval to drift from Crosscut No. 1 north in a direction S 82° W from approximate coordinate N 1850. The field examiners advise that they concur in that location and direction of the drifting even though their report previously submitted recommended drifting westerly from approximate coordinate N 2,000.

It will be necessary to omit for the present drifting to the east from the Crosscut No. 1 north as previously recommended by the field examiners and this office, because the Operator does not, at present, hold clear title to the land involved.

In addition to providing for Stage II drifting in Area A, the amendment should also include provision for Stage II drilling from the Crosscut No. 1 north, or from drifts therefrom.

It is recommended that Summit claims Nos. 4, 5, 7, 8, and 16 be included in the ground subordination under Article 2 of the contract.

Re: Docket No. D.M.E.A. 4568 (Molybdenum
Contract No. Idm-E1094
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico

Dear Mr. Townsend:

To supplement our application of April 23rd in which we asked for (1) To extend No. 7 Crosscut North from approximate coordinates N 150 to N 1200;

(2) To drift approximately S 82° W from approximate coordinate N 1850 in Crosscut No. 1 North, 1,000 feet.

We understand in conference with your representatives that "(1)" will not be approved.

We also understand that "(2)" is being considered more favorably but its approval will depend upon amending the contract to include this work under Stage II.

The work under "(2)" together with later anticipated drilling from this drift, if approved, will require the subordination of additional claims under the contract.

We therefore ask that, provided approval is given for all or an appreciable part of our request "(2)" that the following additional claims be subordinated under the contract: Summit No. 4, 5, 7, 8 and 16.

It has been suggested, in connection with our application of April 23, that drifting to the east from Crosscut No. 1 North would be desirable. Unfortunately, this work would enter the Hercules Group which the Molybdenum Corporation has purchased but the title of which has not been definitely cleared.

We are enclosing herewith a claim map showing the mine workings to June 1st; the proposed work from Crosscut No. 1 North; the claims, bounded by red lines already subordinated; the claims requested to be subordinated bounded by orange lines and the Hercules Group bounded by green lines.

This letter will replace our letter of September 16, 1958 regarding subordination of claims on which no action has been taken by the government.

Yours very truly,

MAY 29 1959

Memorandum

To: Executive Officer, OME Field Team, Region III

From: Chairman, Operating Committee, OME

Subject: Docket No. IMEA-4568 (Molybdenum)
Molybdenum Corporation of America
Moly or Questa Mine
Taos County, New Mexico
Contract No. Idm-E1094

This is in response to your memorandum of May 19, 1959, pertaining to Government participation in additional underground exploration of the area north of the 2nd level west drift.

We concur in your recommendation that the area should be explored by drifting east and west from No. 1 crosscut N. at approximately coordinate 2000 N. It is suggested, however, that initial approval be granted for 300 feet of drift from each side of the crosscut. If results warrant, then additional work could be approved. We also concur in your recommendation that the Operator's request to extend No. 7 crosscut to the north should be denied at this time. If the proposed west drift from No. 1 crosscut indicates that this area is favorable, it could be explored by drilling or crosscutting from the drift.

Since the proposed drifts are in Area A, an amendment to the contract will be required. The amendment should also include the new claims to be subordinated. With respect to the new claims, the Operator should subordinate the claims mentioned in your memorandum and probably more. With this in mind, kindly have the Operator submit five copies of a map showing all the claims held; then we will select the claims that we believe should be subordinated. This map should show the principal drifts and crosscuts as well as the proposed drifts from No. 1 crosscut N. Upon receipt of these data we will prepare the proposed amendment.

Will you kindly request the field examiners to take some check samples when they inspect the mine. It might be well at this time to check the Operator's results by cutting a few duplicate samples. toward the present face of No. 1 crosscut north.

43683

On May 27, 1959, Mr. J. B. Carman, in a (local) telephone conversation with Mr. Murphy, asked if the corporation's proposal for new work mentioned in his letter dated April 23, 1959, to you had been considered. Mr. Murphy stated that drifts from No. 1 crosscut N. might be approved, but at this time the proposed extension of No. 7 crosscut to the north would not be approved.

Mr. Murphy also mentioned that drifts both east and west from No. 1 crosscut were being considered. Mr. Carman then stated that he could see no need of the east drift since it would enter an area that had previously been explored by the company. Mr. Murphy said that we had no information on such work and it would be best for Mr. Carman to discuss the matter with you. He agreed to do so and said that he would visit you on his return from Washington.

Dear Mr. Carman:

Reference is made to your letter of May 18, 1959, wherein you request Government approval for the drilling of two holes f rom the No. 7 XCN, and three holes from the No. 1 XCN.

The No. 1 XCN is in area A, and there is presently no provisions in the contract for drilling in that area under Stage II; therefore, it will be necessary to defer action on your requested approval for the drilling until the matter of extending the two crosscuts is resolved.

Very truly yours,

Memorandum

TO: E. N. Harshman)
Carl Belser) w/enclosures

From: Executive Officer, OME Field Team, Region III

Subject: Docket No. DMMA 4568 (Molybdenum) Contract No. Dm-K1094
Molybdenum Corporation of America (Moly or Questa mine)
Taos County, New Mexico

Enclosed is a copy of the Operator's letter of May 18, 1959, wherein Government approval is requested for the drilling of two holes from the No. 7 XCN, and three holes from the No. 1 XCN.

The holes would be drilled from portions of the crosscuts that were driven at company expense without Government participation, under the provisions of the DMMA Contract.

The No. 1 XCN is in Area A, and there is no provision in the contract for drilling in that area under Stage II. Under the circumstances, and in reference to matters discussed in the teletype from the Chairman, Operating Committee, dated August 29, 1958, regarding additional work, it appears that the matter of the drilling requested must be deferred until we have received a decision from Washington regarding the proposed extension of the No. 1 XCN, and drifting easterly and westerly from it, which is now under consideration.

When the foregoing matter has been resolved, please submit a Joint Memorandum Report containing your recommendations relative to the requested drilling.

Re: Docket D.M.E.A. 4568 (Molybdenum)
Contract Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

We ask approval of the following drill holes in connection with the above contract.

2nd LEVEL DRIFT WEST CROSSCUT No. 7 NORTH

Hole No.	Bearing	Inclination	Coordinate	
32	0	-90°	S 200	W 970
33	0	-90°	N 100	W 1270

The objective of these holes is to reach and explore underlying porphyry contact.

2nd LEVEL DRIFT WEST CROSSCUT No. 1 NORTH

34	0	plus 90°	N 1400	E 1100
35	N 65° E	plus 45°	N 1600	E 1110
36	0	plus 90°	N 1840	E 1040

The objective of these holes is to determine the overlying contact of the granite with the green rock and determine mineralization in the vicinity of the contact.

As you are quite familiar with the geology in both of these areas, we have dispensed with detailing all our reasons for this request but will be glad to add more if you wish.

Yours very truly,

Dear Mr. Townsend:

We herewith ask approval to cancel drill hole No. 19.

Drill hole No. 19 is located in No. 2 CxN at about coordinate E 425 and N 410.

No. 2 CxN was in extremely heavy ground and we were unable to keep it open long enough to finish drilling. We have tried opening it up again but the cost would be prohibitive.

Yours very truly,

Memorandum

TO: Chairman, Operating Committee, OME

From: OME Field Team, Region III

Subject: Docket No. DMEA 4568 (Molybdenum) Contract No. Idm-E1094
Molybdenum Corporation of America (Moly or Questa mine)
Taos County, New Mexico

Enclosed are the following pertaining to Government approval for additional drifting under the subject contract.

1. The original and one copy of the Operator's letter of April 23, 1959, with attached data constituting a request for the additional work.

2. The original and two copies of a Memorandum Report dated May 14, 1959 from R. U. King, Geologist, Geological Survey, and Carl Belser, Mining Engineer, Bureau of Mines, pertaining to the Operator's work request.

The Operator requests Government approval, under the provisions of the contract, to extend the No. 7 XCN due north for 1,000 ft. and to drift S 82° W from the No. 1 XCN a distance of 1,000 ft.

This office concurs in the field examiners recommendations that:

1. The extension of the No. 7 XCN be denied. agree

2. Approval be granted for drifting 1,000 ft., both easterly and westerly, from the No. 1 XCN approximately along coordinate N 2,000 ft., also provisions be made to establish a starting point of Government participation in extending the No. 1 XCN to the north as required to reach the starting point of the easterly and westerly drifts.

Approval for the drifting easterly and westerly will necessitate including additional ground to that presently subordinating under the contract.

By letter of September 16, 1958, the Operator proposed subordinating to the Government the Summit claims Nos. 4, 7, and 16; however, it appears that the Summit claims Nos. 5 and 8 should also be subordinated.

In addition if favorable consideration is to be given for Government participation in the drifting easterly from the No. 1 XCN, at least the Buena Vista No. 6, Renegade and Phyllis No. 5 claims should be subordinated. The Operator has indicated willingness to subordinate such additional ground as required by the Government.

If you concur with our recommendations regarding the crosscutting and drifting easterly and westerly, please advise, and we will initiate action with the Operator in obtaining approval for including such additional grounds as you consider necessary.

Memorandum

To: Executive Officer, OME Field Team, Region III
Through: E. N. Harshman

From: R. U. King
Carl Belser

Subject: Docket DMEA 4568 (Molybdenum), Contract Idm-E 1094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico

The operator in a letter of April 23, 1959, requests approval (1) to extend No. 7 crosscut north for a distance of 1050 feet due north, and (2) to drift S 82° W a distance of 1,000 feet from No. 1 crosscut north at about coordinate 1850 N. The operator's justification for these two proposals arises from the favorable results obtained from driving the No. 7 crosscut north and the No. 1 crosscut north at company expense. Also, he has found it necessary to abandon preliminary exploration by surface drilling owing to the extreme difficulties of drilling and the expense involved.

Proposed extension of No. 7 crosscut north

Inspection of the assay plan of the No. 7 crosscut north does not bear out the operator's contention that the grade of MoS_2 has increased significantly toward the face. Assay averages for the last 100-foot intervals amount to 0.26 and 0.16 percent MoS_2 for the 5-foot wall samples, and 0.19 and 0.20 percent MoS_2 for the February and March

monthly composite car grab samples. This is virtually the same as the grade in the last several hundred feet of the West Drift (0.12 to 0.23 percent MoS_2).

At this time no evidence exists to support the operator's conclusion that ore-grade material occurs along the contact of the Green rock with the porphyry (fig. 1). The high grade ore in holes 22 and 27 which the operator relates to the porphyry (Goat Hill rhyolite porphyry) is better explained as related to the downward projection of the known trend of mineralization on the soda granite-green rock contact.

In addition, Surface Drill hole II A (fig. 1) which bottomed within 500 feet vertically and 100 feet horizontally of the area (1200 N, 1200 W) of proposed exploration, averaged about 0.07 percent MoS_2 for the entire 1,160 feet of the hole. It appears that the surface geochemical anomalies in the western area may be adequately accounted for by the MoS_2 mineralization penetrated by hole II A. Because of the uniformity of mineralization discovered to date and lack of evidence of high grade material in this area, it is recommended that the request to extend No. 7 crosscut north along coord W 1300 be denied.

Proposed drifting S 82° W from No. 1 crosscut north

The grade of mineralization over the last 500 feet in the No. 1 crosscut north (fig. 2) is about twice that of the first 1,500 feet and about equal to that found in the higher grade zone (0.25 percent) along the West drift. Further exploration is warranted in this area for the following reasons: (1) the crosscut has penetrated material that is approaching ore grade (1957 average grade at Climax was 0.367 percent MoS_2);

and (2) the proximity of the crosscut to the area of highest geochemical soil anomalies, the area of high grade near surface deposits, and the Granite-Green rock contact, still the best ore guide available, all point to the conclusion that higher grade material is more likely to be discovered in this area than elsewhere.

It is concluded that it would be to the Government's advantage to determine the limits of the potential ore-bearing zone below the anomalous area close to the area of known high grade mineralization, and in the vicinity of the Granite-Green rock contact. This information can probably be most readily obtained by drifting both westward and eastward along coordinate 2000 N from the No. 1 crosscut north, and by drilling from these proposed drifts, as well as from the existing part of the No. 1 crosscut north.

The operator's request is to drift 1,000 feet S 82° W from a convenient point along No. 1 crosscut north, and is considered to be reasonable, but the examiners recommend that the proposal be modified to drifting 1,000 feet both easterly and westerly on the 2000 N coordinate.

The above recommended exploration will require subordination of additional claims north and east of the presently subordinated block, a portion of which ground was referred to in correspondence to the Operating Committee dated October 28, 1958. The operator has advised that the company has purchased recently and owns ground adjoining the area of proposed exploration. It is suggested that he be advised to submit for subordination sufficient claims to cover the projected work.

Re: Contract [illegible] (Molybdenum)
Contract 14n-[illegible]
Molybdenum Corporation of America
(Only or Questa mine)
Taos County, New Mexico

Dear Mr. Gresslin:

Supplementing drilling approval dated September 30, 1958, and in reference to your letter of May 11, 1959, requesting the drilling of Hole No. 29 to a depth greater than 500 feet, this constitutes Government concurrence for the drilling of the hole to a greater depth.

Hole No. 29 may be contained within practical limits as long as the visible MoS2 is estimated to be in excess of 0.25%.

Nothing in this concurrence in the drilling of Hole No. 29 to greater depth shall be construed to increase the estimated total cost of the project, the aggregate amount which the Government may be required to contribute, nor the fixed unit cost of any item of work.

Very truly yours,

ORE Field Team, Region III

Contract IDM-F1094
(Moly or Questa Mine)
Taos County, New Mexico
Molybdenum Corp. of America

Dear Mr. Townsend:

We herewith ask your approval to continue drilling hole No. 29 beyond 500 foot. Diamond drill hole No. 29 is located at coordinate 85CE and about 150 south, bearing south at a minus 45 degree.

We hit Granite at 140 feet and are still in Granite with some good mineralization.

Yours very truly,

A. B. Gresslin

Re: Docket No. D.M.E.A. 4568
Molybdenum
Contract No. Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

Our requests of August 14, 1958 and November 25, 1958 for additional drifting to the north of the 2nd level drift west by extending the No. 1 Cx N (at 1200 E on the West Drift) and driving crosscut No. 7 N, northwest from 800 W on the West Drift, were denied pending the outcome of the surface drill holes I, II, III and IV.

In the meantime, No. 1 crosscut has been advanced about 1000 feet to approximately 1850 N, 1000 E and No. 7 crosscut to about 150 N, 1300 W. Both disclose what we consider very encouraging results, both geological and mineralogical. These results corollate very well with geological projections and geochemical results. Details are given in Dr. Carpenter's summary, attached hereto.

The following maps and data are included:

maps placed in envelope below folder #3

PLATE I. Surface, topography, geology, geochemical results, surface drill hole locations, as originally planned, and mine workings including some of the old mine workings.

PLATE II. Geology, Crosscut No. 1 North.

PLATE II-A. Assay map of Crosscut No. 1 North.

PLATE III. Geology, Crosscut No. 7 North.

PLATE III-A. Assay map, Crosscut No. 7 North.

PLATE IV. Horizontal and Vertical projection of drill hole No. II-A.

Log of drill hole II-A.

SURFACE DRILL HOLES:

Hole II was driven to 780 feet and abandoned. Hole II-A was then started near II and after many difficulties bottomed at 1160 feet on April 13, 1959. About 2350 feet of drilling, not including reaming and lost equipment was done to get 1160 feet of "effective" hole and, at a prohibitive cost.

April 23, 1959

Mr. J. W. Townsend
Member Field Team Region III
Denver, Colorado.

Re: Docket No. D.M.E.A. 4568
Molybdenum
Contract No. Idm-E1094

This hole was planned to go S-30° E at 450° inclination; it bottomed several hundred feet west and 150 feet above its planned objective as shown on Plate IV. The depth of the glassy volcanics and the location of porphyry is the only significant information obtained from it. (See log of Hole II-A).

With the unfortunate outcome of Hole II-A as to cost and information, and in addition the fact that the underground work is nearing the area which the holes were planned to explore, it has been decided to do no more long hole drilling from the surface. It is evident to us that the best means of exploring in this area is by drifts with subsequent drilling from them.

We therefore ask, in view of the foregoing, that you approve O.D.M. participation in the following:

(1) To extend No. 7 Crosscut North, north from approximate coordinates N-150 to N-1200.

(2) To drift approximately S 82° W from coordinate N-1850 in Crosscut No. 1 North, 1000 feet. We would appreciate having the north coordinate of the take-off of this drift flexible as we are now extending this crosscut and by the time we get a decision on this application we may encounter a more desirable location north of 1850 for drifting westward.

Yours very truly,

SUMMARY OF EXPLORATION AT THE QUESTA MINE QUESTA, NEW MEXICO

Critical relationships have become apparent as a result of recent exploration work at the Questa mine in Taos County, New Mexico, particularly in No. 1 crosscut north.

A well mineralized zone was encountered in this crosscut from coordinates 1524 north to 1791 north; the average MoS_2 content is approximately 0.24% in this interval. The molybdenite occurs in narrow veinlets with quartz and sparse pyrite, as paint on joint surfaces, and in veins several inches in width accompanied by gangue minerals. This zone is shown on Plate 2.

In the vicinity of coordinate 1850 north in No. 1 crosscut north, strong molybdenite mineralization was encountered in highly fractured rocks. The MoS_2 occurs along faults and on joint surfaces for the most part; very few quartz-molybdenite veinlets were noted. This zone averages about 0.37% MoS_2 for over a hundred feet.

A northeast trending dike of grey granite porphyry containing potash feldspar phenocrysts up to 15 mm in length and plagioclase phenocrysts up to 8 mm long embedded in a groundmass of microcrystalline mosaic of quartz and potash feldspar was intersected at approximately coordinate 880 north. It is believed to be the same dike which was found in No. 2 crosscut north, in the main west drift, and in No. 4 crosscut south.

To the north of this dike the granitic rocks alternate between this type of porphyry and the so called red rock, a porphyry of similar composition, but consisting largely of a mosaic of quartz and feldspar with numerous phenocrysts of plagioclase and sparse potassium feldspar phenocrysts. This rock probably should be classified either as a porphyritic aplite or as

a fine grained granite porphyry.

Both types have been well sericitized, and locally, such as the zone from 1700 N to 1850 N, highly kaolinized as well. Strong mineralization is present in areas of intense kaolinization and in areas of intense sericitization.

The geochemical anomoly which trends westerly from upper Sulfur Gulch to Goat Hill Gulch on the surface, and shown on Plate 1, lies directly above and to the north of the mineralization in No. 1 XCN at coordinate 1850 N. On the surface appreciable shattering is present in the extremely altered rocks along this trend.

Porphyry similar in type to the porphyry found on the surface on Goat Hill has been intersected in No. 7 crosscut northwest at the turnoff from the main drift west, and in the vicinity of coordinate 50 north along the south wall and in the back. Alteration has been extreme, but quartz phenocrysts are evident just as in the case of the Goat Hill porphyry. Quartz phenocrysts are not apparent in the granite porphyries of the 200 exploration level.

The "green rock" sequence occurring in No. 7 crosscut northwest is believed to consist largely of andesitic flows, tuffs, and sediments. These rocks have been chloritized and locally flooded by later altering solutions resulting in rocks which are brownish, brittle, partly silicified, and sporadically mineralized. In general, the zones of superposed alteration, just described, are more strongly mineralized. The altering solutions may have been derived from the Goat Hill porphyry.

Molybdenite in No. 7 XCNW occurs as paint on joint surfaces, with quartz and pyrite in small veinlets and on major fractures. Plate 3 illustrates the structural fabric encountered along this crosscut.

It is my conclusion after a review of data made avaliable from geologic studies on the surface and underground that additional exploration is highly desirable in an arc northward, westward, and northeastward from No. 7 XCNW , and westward and northward from No. 1 XCN. On the surface above this arc and underground the following significant geologic features are present:

a. Very intense hydrothermal alteration is evident along this zone from the Questa mine granite porphyry body in Sulfur Gulch westward to the Goat Hill porphyry body.

b. Strong structural development is discernable along this zone including east-west trending, mineralized fissures in Sulfur Gulch and northeast trending faults in Goat Hill Gulch.

c. A pronounced geochemical anomoly extends from Sulfur Gulch westward to the Goat Hill porphyry body (Plate 1)

d. Small porphyry necks and dikes are found along this zone.

e. The Questa mine granite porphyry body plunges westward from the surface at a low angle down to at least No. 1 XCN. (Plate 2) Mineralization is present at the surface and in No. 1 XCN.

f. Mineralization is present in No. 7 XCNW; porphyry of the Goat Hill type also was noted in this crosscut. (Plate 3)

It is my recommendation that a drift be driven westerly for 1,000 feet at a favorable location at or to the north of Coordinate 1850 north in No. 1 crosscut north. It is my recommendation that No. 7 XCN be turned north at Coordinate 1300 west, and driven north for 1,000 feet. It also is my recommendation that from these workings diamond drilling be completed to test all reasonable possibilities of ore occurrences along this are in plan, at depth, and upward (particularly on the eastern side of the arc.)

It is my opinion that ore may occur along this zone at any place where there has been appreciable rock failure in relatively brittle rocks prior to molybdenite mineralization.

Respectfully submitted,

Robert H. Carpenter

Dear Mr. Greslin:

In reference to your letter of April 22, 1959, this constitutes concurrence by the Government for you to discontinue drilling in hole No. 22 at a depth of 800 feet, due to adverse drilling conditions encountered. The hole is considered completed at its present depth of 800 feet.

Very truly yours,

OME Field Team, Region III

Contract I.D.M. E1094
(Moly or Questa Mine)
Taos County, New Mexico
Molybdenum Corp. of America

Dear Mr. Townsend:

We Herewith ask your approval to discontinue drilling in hole No.22 located in 5cxs bearing 60 degrees west at a -70 degrees.

We set up on this hole again and drilled beyond 500 feet to a depth of 800 feet. That was as far as they could drill with their equipment. There was some good mineralization still showing in the core when we had to quit.

Yours very truly

Dear Mr. Townsend:

We herewith ask your approval to discontinue drilling in hole No. 27 in No. 4 CxS, at Coordinate 700 S. It is a minus 90 degree hole.

We drilled hole No. 27 to a depth of 679 feet but stuck the rods and lost some of them as well as the bit in the hole and couldn't get them out.

Yours very truly,

A. L. Greslin

Memorandum

To: Executive Officer, OME Field Team, Region III
Through: E. N. Harshman

From: R. U. King

Subject: DMEA Docket 4568 (Molybdenum), Contract Idm-E 1094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico
INTERIM GEOLOGIC REPORT

Exploration at the Questa mine during the period October 1958 to March 1959, consisted of 2,500 feet of core drilling, done under Stage II of the contract, about 1,500 feet of crosscutting and 700 feet of core drilling from the surface, done by the operator. A check of the operator's analytical (1957) results, begun early in 1958, indicates that his revised (1958) analytical procedures are reliable.

Two inclined down holes from the No. 5 crosscut south average better than 0.2 percent MoS_2 for their entire lengths, and one vertical down hole averages better than 0.4 percent MoS_2 for its first 640 feet. These results are further evidence of a significant body of marginal grade ore within the limits of the explored mineralized (0.1 percent MoS_2 +) area. The body, only vaguely outlined to date, seems to trend from the area of the company's former workings westward along the west drift and across the Nos. 4 and 5 crosscuts south (fig. 1); its dip

or plunge can only be surmized (figs. 3, 4, and 5). The two holes drilled from the southern extremity of No. 4 crosscut south show no improvement in MoS_2 mineralization nor other evidence of increase in rock alteration over that occurring in the last 100 feet of the crosscut, from which it is concluded that further exploration in a southerly direction is not warranted.

On its own account, the operator has pushed the No. 1 crosscut north to about the N 1800 coordinate and the No. 7 crosscut north (northwest extension of west drift) to about the 00 coordinate. The objective of this work is to explore at depth the suspected favorable ground under the geochemical (Mo) soil anomaly "highs". The face of No. 1 crosscut north is still about 500 short (south) of the anomalous area, and the No. 7 crosscut north is about 1,000 feet short (southeast) of its target area. A slight improvement in MoS_2 mineralization in the current headings is reported, but no significant changes in structure or rock type have been noted.

It is felt that the anomalies offer a favorable target area and that further exploration on the 7,800 level is warranted. Proposals for underground exploration by drifting or drilling however will logically depend on analysis of results of current company surface drilling in this area.

Greater confidence in drill hole sample data has resulted from much improved core recovery (50 to 75 percent) being obtained by

the new drilling contractor (Boyles Bros). It is expected that both core and sludge analyses can be used directly in future determinations of grade of mineralization.

An estimate of the quantity of sub-grade molybdenite ore in the explored area 3,000 x 2,000 feet, obtained by including all assays amounts to 400,000,000 tons for a body 800 feet in thickness. The average grade of this material is 0.2 percent MoS_2. By eliminating fringe areas known to average less than 0.2 percent MoS_2, the tonnage is reduced 50 percent but the grade is increased only to 0.25 percent MoS_2.

In conjunction with the checking of the operator's analytical procedures, a moderate number of spectrographic analyses were made. A summary of the data is shown in the attached table.

Re: Docket D.M.E.A. 4568
(Molybdenum)
Contract IDM-E 1094
Molybdenum Corp. of Am.
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

We herewith ask your approval to discontinue drilling in hole No. 26 No. 26 in No. 4 CxS at coordinate 700 S. It is a plus 45 degree hole bearing West.

We drilled hole No. 26 to a depth of 396 feet but had to stop because it was squeezing so bad we couldn't get back to the bottom of the hole. Going into the hole with the rods and core barrel we would get a core barrel full of broken core before we could get to the bottom of the hole.

Yours very truly,

A. L. Greslin

Re: Docket No. [redacted] 4968
(Molybdenum)
Contract 16s-21034
Molybdenum Corporation of America
(Moly or Questa mine)
Taos County, New Mexico

Dear Mr. Carman:

In reference to your letter of March 3, 1959, this confirms verbal approval given by the Government for you to perform the following work under Stage II of the captioned contract.

1. Drill two holes as follows:

Hole No.	Location	Inclination
30	No. 4 x-cut S., at approx. coord. 1300 S	-90°
31	West drift, at approx. coord. 800 W	-90°

The two holes are to be drilled in accordance with the general provisions of EXHIBIT "A" to the contract, as amended by Amendment No. 2. Drilling in the holes may be continued, within practical limits, as long as the visible MoS_2 mineralization is estimated to be in excess of 0.2 percent.

2. Continue drilling in hole No. 22, as practicable, as long as the visible MoS_2 mineralization is estimated to be in excess of 0.2 percent.

3. Re-enter hole No. 27, and drill beyond present length of 500 feet, as practicable, as long as the visible MoS_2 mineralization is estimated to be in excess of 0.2 percent.

Nothing in the verbal approval, or this confirmation thereof, shall be construed to increase the estimated total cost of the project, the aggregate amount which the Government may be required to contribute, nor the fixed unit cost of any item of work.

Very truly yours,

OME Field Team

Re: Docket D.M.E.A. 4568
(Molybdenum)
Contract Idm-E1094
Molybdenum Corporation of America
(Moly or Questa Mine)
Taos County, New Mexico

Dear Mr. Townsend:

We ask approval of the following as part of Area B Stage II drilling program on the 2nd Tunnel Shaft Level.

	Hole No.	Location	Inclination	Bearing
(1)	30	No. 4 X-Cut S at Coord. 1200 S	-90°	---
(2)	31	Drift West at Coordinate 800 W	-90°	---

Hole No. 30 will explore the area to the south of Hole No. 27 which has shown interesting mineralization.

Hole No. 31 will explore below the level ore indications exposed nearby in Cx No. 7 North.

(3) Continue Hole No. 27 in the No. 4 X-Cut S at coordinate 700 S beyond 500 feet an indefinite distance depending on MoS2 mineralization.

(4) Re-enter, if possible, Hole No. 22 located in the face of No. 5 Cx S (New) at approximate coordinates E400-S590 bearing S 60° W and inclined at -70° and drill beyond 500 feet under the same plan as (3) above.

Our wish to continue these holes is based on the comparatively good assays found at or near the bottom of each.

Yours very truly,

March 16, 1959

Memorandum

To: Executive Officer, OME Field Team, Region III
Through: E. N. Harshman EMH

From: R. U. King
Carl Balser

Subject: DMEA Docket 4568 (Molybdenum), Contract Idm-X 1094, Molybdenum Corporation of America (Moly or Questa mine), Taos County, New Mexico

In a letter dated March 3, 1959, the operator requested (1) to drill a vertical down hole from each of two locations on the 2nd tunnel shaft level at approximate coordinates 1200 S, 300 W and 350 S, 800 W, (2) to re-enter and deepen hole 22 if practicable, and (3) to continue hole 27 beyond a 500-foot depth. Verbal authorization of the Field Team was conveyed to the operator, pending receipt of his letter of justification.

Because favorable results have been obtained in the first 500 feet below the level (0.4 percent MoS_2) in hole No. 27, it is concluded that additional exploration is warranted, and that this hole should be continued to reasonable depths beyond the 500-foot point as long as the grade of mineralization holds up.

The proposed -90° holes from the West Drift and No. 4 crosscut south are considered necessary to determine the extent and attitude of the ore-grade material discovered in hole No. 27. Deepening of hole No. 22 (No. 5 crosscut south) is likewise justified, particularly as because of the high grade assays obtained at the bottom of this hole.

It is recommended that the operator's request be approved as follows:

1. Continue hole No. 27 beyond 500 feet, as practicable, provided visible MoS_2 mineralization is estimated to be better than 0.2 percent.

2. Re-occupy hole No. 22 and deepen as under (1) above.

3. Vertical down hole from West Drift at approximate coordinates 350 S, 800 W, with depth limitation as per (1) above.

4. Vertical down hole from No. 4 crosscut south at approximate coordinates 1200 S, 300 W, with depth limitations as per (1) above.
