Summary of Drill Hole Logs

GEOLOGIC REPORT

Summary

The Puncheon Camp Creek zinc prospect is located in the Copper Ridge Zinc district along Tennessee highway 131 five miles southwest of Thorn Hill, Grainger County, Tennessee. Investigations were begun by B. H. Putnam, Operator, in June, 1956, to prospect for commercial deposits of zinc.

During the period from July, 1957 to July, 1960, ninety-seven holes were drilled for a total of 51,189 feet, of which 47,838 feet were drilled with DMEA aid. Six holes were drilled by B. H. Putnam, Operator; seventy-one by B. H. Putnam, Operator, and the DMEA; and twenty by National Lead Company and the DMEA. Drilling to date has disclosed the presence of a mineralized body containing an estimated 450,000 tons of 3% zinc.

Work Performed

Investigations were begun by B. H. Putnam, Operator in the Puncheon Camp Creek area in 1956 to determine if commercial deposits of zinc are present. The examination consisted of geologic mapping and prospecting followed by a geochemical survey for zinc. Plotting on the map of the zinc content of the samples revealed the presence of a series of positive soil anomalies along the Mascot-Kingsport contact and the top of the Lower Kingsport member of the Kingsport formation along the entire length of the area for a distance of 7400 feet. Additional samples were taken both north and south of the original sampling pattern until all of the anomalous areas were outlined. As a result of this work, the anomalies which previously appeared to be scattered were enlarged and localized into several large anomalies.

On the southwesternmost portion of the property there is a large anomaly having a strike extent of 1400 feet and a dip extent of 1750 feet. Zinc values in the anomalous areas range from .05% to 0.30 + % with background values ranging from 0.02% to 0.05%. Northeast of this anomaly, smaller anomalies occur along strike for a distance of 2800 feet. Beginning on the southwest end of the Stapleton farm and continuing northeast along strike for a distance of 2300 feet, practically the entire zone of the lower part of the Mascot, Kingsport, and the upper part of the Longview is anomalous.

In December, 1956, an application for aid to explore the Puncheon Camp Creek area was filed with the DMEA. In March, 1957, an agreement was reached between National Lead Company and B. H. Putnam, Operator, whereby National Lead Company would assume the responsibilities of the DMEA contract and complete the exploration program. On May 21, 1957, an agreement was reached, and a contract signed, between the DMEA and National Lead Company, to explore the commercial possibilities of zinc mineralization in the Puncheon Camp Creek area. In this contract, the government agreed to contribute 50% of the costs requested for exploration or up to $85,062.50. The $170,125.00 is the total of the estimated costs of $150,000.00 for 50,000 feet of drilling at $3.00 per foot; $10,000.00 for 5,000 feet of reaming at $2.00 per foot; $825.00 for 550 assays; $300.00 for 150 core boxes; and $9000.00 for incidentals at $0.18 per foot of drilling.

Drilling commenced on the project, under the DMEA contract, on July 26, 1957. From July, 1957, to March, 1958, National Lead Company drilled twenty holes totalling 13,158 feet of the allotted 50,000 feet. In March, 1958, National Lead Company informed B. H. Putnam of their intention to withdraw from the project. The Putnam group accepted the assignment of the DMEA contract from National Lead Company.

During the period of assigning the contract, the drilling program was informally recessed. On April 8, 1959, core drilling was resumed by B. H. Putnam, Operator, and the DMEA. From April 8, 1959 to June 29, 1960, Putnam drilled 77 holes totalling 47,841 feet. Of this drilling, 6 holes totalling 3351 feet were drilled without DMEA aid.

In March 23, 1960, an agreement was reached between The New Jersey Zinc Company and B. H. Putnam in which the Zinc Company would finance and supervise the remaining drilling program. This agreement included all of the properties in the contract area except the Green-Dalton property, the Rosa Bullen property, and the eastern tract of the W. B. Dalton property. Neither the DMEA contract nor the properties were assigned to the Zinc Company. A total of 19 holes were drilled under this agreement. The drilling on this project was terminated on June 29, 1960 with the bottoming of hole JA-16.

Property

The properties included within the Puncheon Camp Creek project area are shown on Plate 2 and are listed below:

Name	Acres
Viva and W. H. Stapleton	218.00
Elvin and Bessie Jackson	105.00
Elmer and French Breeding	15.00
S. S. and Sallie Breeding	51.00
Austin and Docie Johnson	45.00
D. R. Coffman, Widower	25.00
Rosa Bullen	~~29.00~~ 60.00
T. A. Green & A. B. Dalton	58.00
Pryor and Gracie Acuff	45.00
W. B. and Sara J. Dalton	77.00
J. C. and Imogene McGinnis	62.00
H. B. and Gynce Winstead	51.00
Dave and Mary Jackson	~~100.00~~ 132.00
William H. and Hance M. Johnson	55.00
Total	936.00

The Dave Jackson (January, 1960) and the W. H. Johnson (December, 1957) properties were added to the project after the contract was entered into.

Stratigraphy

The Puncheon Camp Creek properties are underlain by the Knox dolomite and Chickamauga limestone of Ordovician age. The Knox underlying the properties can be divided into the Chepultepec, the Longview, the Kingsport, and the Mascot formations. Since the drilling was confined to the exploration of the Mascot, Kingsport, and Upper part of the Longview, only these formations will be discussed.

Mascot formation: At Puncheon Camp Creek, the Mascot is approximately 650 feet thick. The top of the formation is unconformably overlain by the Chickamauga limestone and the base is marked by a thin chert-cemented quartz-sand layer known as the chert-Matrix (CEMTX) sand.

The formation is mostly well-bedded light, medium, and dark gray, fine crystalline dolomite, occasionally interbedded with thin beds of medium and coarse crystalline dolomite. Chert layers and nodules and thin quartz sands are randomly scattered throughout the formation.

Outcrops of the Mascot are common, especially in the upper part of the formation, and occur throughout the strike length of the property. The best exposures occur along Puncheon Camp Creek and the adjacent slopes. Although brecciation and mineralization of the dolomite have been observed throughout the formation they appear to be more common near the base.

Kingsport formation: The underlying Kingsport formation is approximately 240 feet thick and is divided into two members, the Upper and Lower Kingsport.

The Upper Kingsport is approximately 140 feet thick and consists mostly of well-bedded, fine-crystalline dolomites. The lithology is similar to the Mascot formation. The top of the unit is marked by the chert-matrix sand, and the base is marked by a shaly coarse-crystalline zone called the TR horizon. The lower part of the member is commonly brecciated and mineralized. The sphalerite is associated with a white dolomite that occurs between the breccia fragments of the host rock.

The Lower Kingsport is approximately 100 feet thick and consists of limestones interbedded with fine, medium, and coarse crystalline dolomites. In and adjacent to the mineralized areas, the limestones are frequently represented by coarse crystalline dolomites. The sphalerite in the Lower Kingsport occurs either as fillings in breccias similar to those previously mentioned or as crystals filling the openings of porous coarse-crystalline dolomites. The top of the unit is marked by the TR horizon and the base is marked by a fine-crystalline dolomite (T bed).

Longview formation: The Kingsport is underlain by the Longview formation which consists of limestone and coarse crystalline dolomites interbedded with fine-crystalline dolomites and chert beds. Although no thick high-grade accumulations of zinc were penetrated, a considerable amount of mineralization was found in the upper part of the formation. One hole (6D-7A)

had scattered mineralization for a penetration thickness of 90 feet below the top of the Longview.

Structure

The average strike of the rocks in the Puncheon Camp Creek area is N 63° E and the dip is 36° south.

Twenty-eight hundred feet southwest of the Puncheon Camp Creek Road, mapping of the Mascot-Chickamauga contact revealed the presence of a northwest trending tear fault. The apparent horizontal displacement is approximately 50 feet with the southwest block displaced to the north. The vertical displacement is on the order of 120 feet if the fault interpreted on section C-1707 is the same one. Sixty-three hundred feet southwest of the Puncheon Camp Creek road, another tear fault has been mapped that trends to the northwest. This fault has an apparent horizontal displacement of 30 feet with the southwest block displaced to the north. The vertical displacement is on the order of 40 feet (Section C-1499). Nine hundred feet southwest of this fault, another tear fault was mapped that trends to the northwest. The southwest block appears to have been horizontally displaced 50 feet or so to the south. The vertical displacement is on the order of 40 feet (Section C-1499).

Nineteen cross-sections were prepared that show the results of the drilling. Ten of them are dip and nine are strike or off-strike sections. The structural interpretations shown on the sections are the product of correlating the data obtained from detailed logging of the core. It is realized that in some cases where good stratigraphic control is lacking, other interpretations of the data could be justifiably made. In these cases, the pattern as interpreted from areas where structural features were more certain was followed.

Excellent control of the different stratigraphic horizons is obtained in the Mascot formation and the Upper Kingsport member of the Kingsport formation. Most of the individual beds within these formations are readily recognized and logged. The sections show only the Chert Matrix (CEMTX) sand but many other recognizable horizons were also used to correlate from hole to hole.

Stratigraphic markers are not as readily recognized or correlated from hole to hole in the Lower Kingsport member as in the stratigraphically higher beds. This is in part due to the brecciation of the lower beds and in part due to the lateral variability of the lithologies. The top and bottom of the Lower Kingsport (TR and T) are usually recognized. The cross-sections show the TR and the T horizons.

Summary of Diamond Drilling

To date, 113 diamond drill holes have been drilled in the Puncheon Camp Creek area. Drilling operations have been conducted over a strike distance of 8200 feet, extending from the western part of the Dave Jackson farm westward to the eastern part of the Austin Johnson farm. The holes drilled are shown on the plan maps and cross-sections accompanying this report. The holes drilled under the DMEA program were on strike and dip fences at least 400 feet apart with holes at least 100 feet apart on the fences. In order to simplify the discussion of the drilling done over the entire project, the project has been divided from east to west into four separate areas. The decision as to what constituted an area is based on the location of the individual geochemical anomalies, the concentration of the drill holes, and the results of the drilling.

The Stapleton-Dave Jackson Area: A total of 39 holes have been drilled in the vicinity of Puncheon Camp Creek on the Dave Jackson and William Stapleton properties. In 1953, prior to the DMEA program, The New Jersey Zinc Company drilled a total of sixteen holes on the Stapleton property. Eleven of the holes were drilled downdip and east of the mineralized outcrops exposed along Puncheon Camp Creek. Five holes were drilled on the western part of the Stapleton farm. Ten of the sixteen holes penetrated various thicknesses of mineralized rock grading less than 12' of 3.9% zinc.

Under the DMEA program National Lead Company or B. H. Putnam, Operator, drilled twenty-three holes in the Stapleton-Dave Jackson area. Four of the holes were drilled on the western part of the Dave Jackson farm (DJ-1 thru 4), and eighteen were drilled on various portions of the Stapleton property (ST-1 thru 18). One hole was drilled on the H. B. Winstead farm (WS-1). Of the twenty-three holes, 13 holes penetrated mineralized rock containing less than 12 feet of

3% zinc. None of the holes penetrated accumulations that assayed 12 feet of 3% zinc or greater.

Most of the exploration activity on these properties was confined to the areas where drilling depths were 500 feet or less. Three holes, ST-1 (607'), ST-3 (642'), and WS-1 (910') were drilled deeper than 500 feet.

Green-Dalton Area: A total of thirty-six holes were drilled on the Green-Dalton farm located west of the W. Stapleton property. Two holes (60-1,2) were drilled by National Lead Company and the DMEA; six holes were drilled by B. H. Putnam, Operator; and twenty-eight were drilled by B. H. Putnam, Operator and the DMEA. Five of the holes penetrated mineralized rock that assayed 12' of 3% zinc or greater, 21 holes penetrated mineralization that assayed less than 12' of 3% zinc and 9 holes were blank.

Geologic studies of the drilling results indicate the presence of a mineralized body trending in a northwest-southeast direction that is 1400 feet in length and averages 100 feet in width. The body varies in thickness from 8 to 36 feet, averaging 16 feet. The grade of the mineralization ranges from 2.2% to 5.9% zinc. Although the mineralization is present over a wide stratigraphic range, the majority of it occurs in the Lower Kingsport formation. The body is still open on the southeast and deeper end. Further drilling along a projection of the indicated trend will probably extend the length and increase the tonnage of this body. Drilling to date indicates that the body contains 450,000 tons that averages 3% zinc.

Central Area: The Central area is composed of the W. B. Dalton, the Rosa Bullen, and the J. C. McGinnis properties. Because of the lack of large geochemical anomalies over the outcrop of the Kingsport dolomite, this area was sparsely drilled. Three holes (DA-1, 2 & DAL-1) were drilled on the two W. B. Dalton tracts. One hole was drilled on the Rosa Bullen property (BUL-1) and six on the J. C. McGinnis tract (MG-1,2,3,4,5,6). Of the ten holes drilled, six found very thin low-grade accumulations of mineralized rock. Seven of the holes (MG,1,2,3,4,5 and DA-1,2) were drilled by National Lead Company and the DMEA and the remaining three were drilled by B. H. Putnam, Operator, and the DMEA.

Elvin Jackson Area: The Elvin Jackson area includes the S. S. Breeding, the D. R. Coffman, the Pryor Acuff, the Elvin Jackson, and the Austin Johnson properties. Drilling in this area was designed to explore for ore that might be expressed surficially by the large geochemical anomaly on the Elvin Jackson farm. A total of twenty-seven holes were drilled on these properties. Two holes (BR-1,2) were drilled on the S. S. Breeding property (by B. H. Putnam & DMEA), Seven (CO-1-7) on the D. R. Coffman property (by National Lead Company & DMEA), One (AC-1) on the Pryor Acuff (by B. H. Putnam & DMEA), Sixteen (JA-1-16) on the Elvin Jackson property (by B. H. Putnam & DMEA). The drilling of nineteen of the holes (JA-3-16; AC-1, AJ-1, BR-1,2, and MG-6) was supervised by The New Jersey Zinc Company under an agreement between the Zinc Company and the B. H. Putnam interests.

Of the twenty-seven holes drilled, twelve intersected scattered low-grade mineralization. One hole (JA-7) penetrated eight feet of mineralization that assayed 12.76% zinc. Attempts to intersect an extension of this mineralization were not successful.

Costs of the DMEA Project

A Summary of the DMEA Supported Costs Incurred During

The Exploration Project Contract

	Authorized by Contract				Incurred by Operator			Government Participation
Operation	Unit	Units	Unit Cost	Costs	Units	Unit Cost	Costs	@ 50%
Drilling	Feet	50,000	3.00	$150,000.00	47,838	2.981	$142,619.25	$71,309.625
Reaming	Feet	5,000	2.00	10,000.00	1,266	2.00	2,532.00	1,266.000
Assays	Each	550	1.25	825.00	237	1.239	293.75	146,875
Core Boxes	Each	150	2.00	300.00	150	1.935	290.25	145.125
Incidental Allowance	Feet	50,000	0.18	9,000.00	47,838	0.18	8,610.84	4,305.420
Totals				$170,125.00			$154,346.09	$77,173.045

Conclusions

Drilling done under the DMEA contract at Puncheon Camp Creek discovered on the Green-Dalton property a zone of mineralization estimated to contain 450,000 tons grading 3% zinc. The body appears to be 1400 feet long, averages 100 feet in width and plunges to the southeast. On the southeast end, the body is 950 feet deep and has not been terminated by drilling. Further deeper drilling along the trend will be expected to extend its length.
