

2009 Minerals Yearbook

ASBESTOS

ASBESTOS

By Robert L. Virta

Domestic survey tables were prepared by Richard H. Kraft, statistical assistant, and the world production table was prepared by Lisa D. Miller, international data coordinator.

Asbestos has not been mined in the United States since 2002, and imports, mostly from Canada, satisfied the needs of domestic consumers. U.S. apparent consumption declined to 869 metric tons (t) in 2009 from 1,460 t in 2008 because of decreased sales to the roofing products industry. World production was 2.07 million metric tons (Mt) in 2009, a decrease from 2.15 Mt in 2008.

Legislation and Government Programs

Health research and asbestos cleanup continued in Libby, MT, where vermiculite contaminated with asbestos was mined and processed, and at several vermiculite processing plants across the country. The Agency for Toxic Substances and Disease Registry announced plans to invest \$8 million in projects to compare the health of people exposed to Libby asbestos in childhood against those not exposed. The study was expected to determine if effects other than lung disease can occur following exposure to Libby asbestos, improve public health records to better track exposure and health outcome, and compare digital-versus-film chest x-rays for efficiency in assessing lung conditions. The U.S. Environmental Protection Agency continued its remedial activities in Libby (Agency for Toxic Substances and Disease Registry, 2009; U.S. Environmental Protection Agency, 2010).

The National Institute of Occupational Safety and Health (NIOSH) released its roadmap for asbestos research in 2008. This plan was reviewed by the National Academy of Sciences and the organization provided recommendations for changes. Some of the recommendations included more focus on the mineralogy of the elongate particles under study, removal of potentially confusing terms from the roadmap glossary section, development of a mineral repository for health research, and further elaboration on its strategy for assessing the health effects of elongate mineral particles (National Academy of Sciences, 2009).

Consumption

U.S. consumption of asbestos was 869 t in 2009, a 41% decrease from 1,460 t in 2008 (table 1). Roofing products accounted for 42% of U.S. consumption; coating and compounds, 30%; diaphragms for the chloralkali industry, 18%; and other, 10%. Most of the asbestos reported under “coating and compounds” probably was used in roofing products. Consequently, roofing applications, which comprised bituminous roof coatings and roof sealants, accounted for 72% of the total U.S. asbestos end-use market (table 2).

Chrysotile was the only type of asbestos used in the United States in 2009, 66% of which was grade 7; the rest consisted of grades 5, 4, and 3, in descending order of percentage.

Prices

The average free alongside ship (f.a.s.) unit value of asbestos fiber exports and reexports was \$1,169 per metric ton in 2009, an increase from \$938 per ton in 2008 (table 4). The average U.S. customs unit value for all grades of imported asbestos increased to \$787 per ton in 2009 from \$746 per ton in 2008 (table 5). The average value of imported crude chrysotile, all from Canada, was \$200 per ton in 2009, a decrease from \$700 per ton in 2008. The average unit value for imports of milled, grade 4 chrysotile was \$1,843 per ton in 2009, a decrease from \$2,062 per ton in 2008. The unit value of all other grades of asbestos combined was \$630 per ton in 2009, an increase from \$455 per ton in 2008 (table 5). Unit values of imported chrysotile have fluctuated in recent years because of the small quantities of asbestos being used by industry.

Foreign Trade

The following section summarizes significant trade statistics on asbestos and products manufactured using asbestos. Detailed trade statistics, by country and individual U.S. port districts, are available from the International Trade Commission’s Interactive Tariff and Trade Dataweb Web site (U.S. International Trade Commission, undated).

In 2009, U.S. exports of asbestos fiber were 59 t with an f.a.s. value of \$69,000, a decrease in tonnage from 368 t valued at \$345,000 in 2008. Asbestos has not been produced in the United States since 2002; thus, reported exports probably consisted of reexports of imported fiber or improperly classified products (table 4). The United States exported and reexported \$24.5 million of asbestos products in 2009, a decrease from \$33.2 million in 2008. Canada was the leading importer, followed by Mexico, the United Kingdom, China, and the Republic of Korea. These five countries accounted for 67% of the value of asbestos products exported and reexported from the United States in 2009 (table 3). The United Kingdom banned the use of asbestos in 1999, so their imports from the United States probably were reexported from the United Kingdom, or they were nonasbestos products misclassified as asbestos products. The same applies to several other countries listed in table 3 that have banned the use of asbestos or asbestos products.

Friction products, including brake linings, clutch linings, and disk pads, accounted for 55% of the value of manufactured products exported in 2009 (table 4). Because no asbestos brake components under Harmonized Tariff Schedule of the United States (HTS) code 6813.20 or asbestos-cement products under HTS code 6811.40 are manufactured in the United States, the values for these two HTS code categories probably represent exports from stocks, reexports of asbestos products, or products incorrectly classified under the HTS codes.

In 2009, the United States imported 869 t of asbestos valued at \$684,000. Canada supplied 91% of the tonnage. Asbestos also was imported from Brazil and Zimbabwe (table 5). Only chrysotile was imported into the United States in 2009. Based on the import source, asbestos listed under “other, unspecified asbestos type” in table 5 probably represented chrysotile.

The United States also imported \$13.3 million of products with a basis of asbestos and products with a basis of asbestos and magnesium carbonate (U.S. International Trade Commission, undated). Some nonasbestos products probably are included under the asbestos HTS codes based on reported asbestos imports from countries that have banned asbestos use (table 6).

World Review

World production of asbestos was estimated to be 2.07 Mt in 2009, a decrease from 2.15 Mt in 2008. Russia was the leading producer of asbestos, followed by China, Brazil, Kazakhstan, and Canada. These five countries accounted for 99% of the world production (table 7).

Korea, Republic of.—The Republic of Korea enacted the final stage of a ban on the use of asbestos in manufactured products, effective September 2009. Under the ban, asbestos may not be used to manufacture any children’s products or products in which asbestos particles may come loose and contact skin. For all other manufactured products, the asbestos content must be less than 0.1%. Under the ban, talc used in the manufacture of paint and wallpaper must be certified to contain less than 1% asbestos (The Chosun Ilbo, 2009).

Zimbabwe.—Workers at the Shabanie Mashaba Mine, a chrysotile mine that is administered by the government, went on strike on August 31, 2009, because of salary issues. The company reportedly also had its electricity disconnected for failure to pay its electric bills. The loss of electrical power resulted in the flooding of the mine (Mpfu, 2010; Whiz, 2010).

Outlook

U.S. consumption continued to decline as markets for asbestos weakened. This trend is likely to continue in the United States as the use of products and technologies that do not require asbestos are further implemented. World production, however, remained nearly 2.0 Mt because of continued demand for asbestos products in many regions of the world. As additional national bans are enacted, world consumption may be further concentrated in fewer regions of the world and world production may begin to decline slightly.
