COPPER

(Data in thousand metric tons of copper content unless otherwise noted)

Domestic Production and Use: U.S. mine production of copper in 2015 decreased by 8% to about 1.25 million tons, and was valued at about $7.6 billion. Arizona, New Mexico, Utah, Nevada, Montana, and Michigan—in descending order of production—accounted for more than 99% of domestic mine production; copper also was recovered in Idaho and Missouri. Twenty-six mines recovered copper, 18 of which accounted for about 99% of production. Three primary smelters, 3 electrolytic and 4 fire refineries, and 15 electrowinning facilities operated during 2015. Refined copper and scrap were used at about 30 brass mills, 14 rod mills, and 500 foundries and miscellaneous consumers. Copper and copper alloys products were used in building construction, 43%; electric and electronic products, 19%; transportation equipment, 19%; consumer and general products, 12%; and industrial machinery and equipment, 7%.1

Recycling: Old scrap, converted to refined metal and alloys, provided 160,000 tons of copper, equivalent to 9% of apparent consumption. Purchased new scrap, derived from fabricating operations, yielded 670,000 tons of contained copper. Of the total copper recovered from scrap (including aluminum- and nickel-base scrap), brass mills recovered 79%; copper smelters, refiners, and ingot makers, 15%; and miscellaneous manufacturers, foundries, and chemical plants, 6%. Copper in all scrap contributed about 32% of the U.S. copper supply.

Import Sources (2011–14): Unmanufactured (ore and concentrates, blister and anodes, refined, and so forth): Chile, 51%; Canada, 26%; Mexico, 16%; and other, 7%. Refined copper accounted for 87% of unmanufactured copper imports.

Depletion Allowance: 15% (Domestic), 14% (Foreign).

Government Stockpile: None.

Events, Trends, and Issues: In 2015, the COMEX spot copper monthly average price increased to $2.89 per pound of copper in May from $2.65 per pound in January. In August, however, it fell to $2.33 per pound, the lowest monthly average since June 2009. The decrease in the copper price was in large part owing to reduced demand growth from

Prepared by Mark Brininstool [(703) 648–7798, mbrininstool@usgs.gov]
slower economic growth in China. At the end of August, domestic stocks of refined copper were 12% lower than those at yearend 2014. The International Copper Study Group (ICSG) projected that in 2015, global refined copper production would exceed consumption by about 40,000 tons. Global production of refined copper was projected to increase by 1.0% and consumption was projected to decrease by 1.2%.6

U.S. mine production decreased by about 8% in 2015, mainly owing to decreases in production in Arizona and Utah. Copper production at the Bingham Canyon Mine in Utah decreased by an estimated 100,000 tons owing to lower mill throughput during repair work on the east wall of the mine. The two leading domestic producers announced production decreases at mines in Arizona during the second half of the year owing to low copper prices. Decreases in production were partly offset by increased production at the Morenci Mine in Arizona and at several smaller mines. Total U.S. refined production decreased by about 5% mainly owing to a smelter maintenance shutdown and a concentrate shortfall at Bingham Canyon’s integrated smelter.

In 2016, domestic mine and refined production of copper were expected to increase moderately, and according to ICSG projections, global refined copper consumption was expected to exceed output owing to consumption growth of 3.0%, outpacing a 2.3% growth in global refined production. Mine and refined production were expected to lag behind earlier projections owing to mine cutbacks and reduced scrap availability attributable to lower prices.

**World Mine Production and Reserves:** Reserves for Australia and Peru were revised based on new information from the Governments of those countries. Reserves for Mexico and the United States were revised based on reported company data.

**World Resources:** A 1998 USGS assessment estimated that 550 million tons of copper was contained in identified and undiscovered resources in the United States. A 2014 USGS global assessment of copper deposits indicated that identified resources contain about 2.1 billion tons of copper (porphyry deposits accounted for 1.8 billion tons of those resources), and undiscovered resources contained an estimated 3.5 billion tons. (For a listing of USGS regional copper resource assessments, go to [http://minerals.usgs.gov/global](http://minerals.usgs.gov/global).)

**Substitutes:** Aluminum substitutes for copper in power cable, electrical equipment, automobile radiators, and cooling and refrigeration tube; titanium and steel are used in heat exchangers; optical fiber substitutes for copper in telecommunications applications; and plastics substitute for copper in water pipe, drain pipe, and plumbing fixtures.
