RECYCLING—METALS [ADVANCE RELEASE]

RECYCLING—METALS

By John F. Papp

Survey data and tables were prepared by Maria Arguelles, E. Lee Bray, Mark Brininstool, Michael D. Fenton, George M. Bedinger, David E. Guberman, Peter H. Kuck, and Amy C. Tolcin.

In 2012, the United States recycled 69.0 million metric tons (Mt) of selected metals, an amount equivalent to 59% of the apparent supply of those metals (table 1). More than 91% of recycled metal was steel, and more than 90% of apparent supply was steel. The United States exported 26.7 Mt of scrap metal and imported 5.3 Mt of these same metals (table 2).

Metals are important, reusable resources. Although the ultimate supply of metal is fixed by nature, human ingenuity determines the quantity available for use in developing economical processes to recover metal from the Earth and recycle metal from the use/process stream. The reusable nature of metals contributes to the sustainability of their use. Recycling, a significant factor in the supply of many of the metals used by society, provides environmental and economic benefits such as energy savings and reduced volumes of waste.

The term “primary” indicates material from ore deposits, and the term “secondary” indicates material from recycling, including used products and residuals from manufacturing. Recycling practices vary substantially among the metal industries. Generally, scrap is categorized as “new” or “old.” “New” indicates preconsumer sources, and “old,” postconsumer sources. The many stages of industrial processing that precede formation of an end product are the sources of new scrap. For example, when metal is converted into shapes—bars, plates, rods, or sheets—new scrap is generated in the form of cuttings, trimmings, and off-specification forms. When these shapes are converted to parts, additional new scrap may be generated in the form of cuttings, stampings, turnings, and off-specification parts. Similarly, when parts are assembled into products, new scrap may be generated. A wide variety of descriptive terms, many duplicative, including external scrap, home scrap, internal scrap, mill scrap, prompt scrap, and purchased scrap, has evolved to describe scrap generated by diverse industry practices.

Once a product completes its useful life, it becomes a source of old scrap. Used appliances, automobiles, and beverage cans are examples of sources of old consumer scrap; used jet engine

blades and vanes, junked machinery and ships, and metal recovered from commercial buildings or industrial plants are examples of old industrial scrap. The material flow of recycled metal commodities in the United States has been documented in a series of reports published by the U.S. Geological Survey (Sibley, 2006–11).

World recycling may be characterized by recycled content of materials and end-of-life recycling rate. One study on the recycling rate of 60 elements showed that the recycling rate of commonly used base metals, such as some of those reported for the United States in this chapter, exceeds 50% and that numerous elements used for very specific technical reasons are seldom recycled (Reck and Graedel, 2012). Another study developed recycling options for select waste electronic equipment to recover raw materials anticipated to be critical to future technologies. Recommended were increased collection rate, reduced illegal export, supportive national policy, improved disassembly, improved recycling methods, temporary storage of waste, and design (of equipment) for recycling (of that equipment) (Buchert and others, 2012).

Individual annual reviews for each of the metals listed in the tables are in the respective chapters in this volume of the U.S. Geological Survey Minerals Yearbook, volume I, Metals and Minerals.

2012	205,000	129,000	334,000	1,080,000	31	432,000	273,000	705,000	2,280,000

²Estimated. ¹Revised. NA Not available. W Withheld to avoid disclosing company proprietary data.

¹Data are rounded to no more than three significant digits; may not add to totals shown.

²Scrap that results from the manufacturing process, including metal and alloy production. New scrap of aluminum, copper, lead, tin, and zinc excludes home scrap, which is scrap generated and recycled in the metal producing plant.

³Scrap that results from consumer products.

⁴Metal recovered from new plus old scrap.

⁵Apparent supply is production plus net imports plus stock changes. Production is primary production plus recycled metal. Net imports are imports minus exports. Apparent supply is calculated on a contained-weight basis.

⁶Also referred to as recycling rate.

⁷Same as apparent supply defined in footnote 5 above but calculated based on a monetary value.

⁸Quantity of metal is the calculated metallic recovery from purchased new and old aluminum-base scrap, estimated for full industry coverage. Monetary value is estimated based on average U.S. market price for primary aluminum metal ingot. Series revised by removing imported scrap to avoid double counting.

⁹Chromium quantity of metal recycled was estimated as chromium content of stainless steel scrap receipts (reported by the iron and steel and pig iron industries). For the calculation of apparent supply, trade includes reported or estimated chromium content of chromite ore, ferrochromium, chromium metal and scrap, a variety of chromium-containing chemicals, and stainless steel mill products and scrap. Stocks include estimated chromium content of reported and estimated producer, consumer, and Government stocks. Recycled monetary value estimated as recycled quantity times the average import value of high-carbon ferrochromium. Apparent supply monetary value estimated like apparent supply quantity with monetary value substituted for chromium content.

¹⁰Includes copper recovered from unalloyed and alloyed copper-base scrap, as refined copper or in alloy forms, as well as copper recovered from aluminum-, nickel-, and zinc-base scrap. Monetary value based on annual average refined copper prices.

¹¹Recycled scrap reported from consuming manufacturers. Apparent supply measured as shipments of iron and steel products plus castings corrected for imported semifinished products. Recycled unit value is the U.S. annual average composite price for No. 1 heavy-melting steel calculated from prices published in American Metal Market. Unit value for the year used to calculate values of recycled scrap and apparent supply of scrap.

¹²Monetary value of scrap and apparent supply estimated based upon average quoted price of common lead.

¹³Includes magnesium content of aluminum-base scrap. Monetary value based on the annual average Platts Metals Week U.S. spot Western magnesium price.

¹⁴Nickel statistics were derived from the following:

Production, consumption, receipts

- Reported nickel content of products made from reclaimed stainless steel dust, spent nickel-cadmium batteries, plating solutions, and other products.
- Estimated nickel content of reported net receipts of alloy and stainless steel scrap.
- Reported nickel content of recovered copper-base scrap.
- Reported nickel content of obsolete and prompt purchased nickel-base scrap.
- Estimated nickel content of various types of reported obsolete and prompt aluminum scrap.

Trade data

- Reported nickel content of International Nickel Study Group (INSG) class I primary products, including briquets, cathode, flake, pellets, and powder.
- Reported or estimated nickel content of INSG class II primary products, including ferronickel, metallurgical-grade nickel oxide, and a variety of nickel-containing chemicals.
- Estimated nickel content of secondary products, including nickel waste and scrap and stainless steel scrap.

Stock data

- Reported or estimated nickel content of all scrap stocks, except copper.
- Reported nickel content of primary products held by world producers in U.S. warehouses.
- Reported nickel content of primary products held by U.S. consumers.
- Reported nickel content of U.S. Government stocks.

Monetary value based on annual average cash price for cathode, as reported by the London Metal Exchange.

¹⁵Monetary value based on Platts Metals Week composite price for tin. Apparent supply excludes withheld stock changes.

¹⁶Percentage recycled based on titanium scrap consumed divided by primary sponge and scrap consumption.

¹⁷Monetary value based on annual average Platts Metals Week metal price for North American Special High-Grade zinc.

TABLE 2

TABLE 2—Continued
 SALIENT U.S. RECYCLING TRADE STATISTICS FOR SELECTED METALS¹

Year	Exports			Imports for consumption		
	Quantity		Value (thousands)	Quantity		Value ² (thousands)
	Gross weight (metric tons)	Contained weight (metric tons)		Gross weight (metric tons)	Contained weight (metric tons)	
Zinc: ⁹						
2008	91,000	NA	99,100	17,000	NA	20,300
2009	47,100	NA	54,300	9,100	NA	8,800
2010	77,900	NA	85,200	15,600	NA	19,400
2011	85,600	NA	93,900	18,500	NA	23,400
2012	90,500	NA	107,000	20,000	NA	24,600

NA Not available.

¹Contained weight based upon 100% of gross, unless otherwise specified.

²Imports value is customs value.

³Includes stainless steel scrap and chromium metal waste and scrap. Contained weight for import and export quantities of Harmonized Tariff Schedule of the United States (HTS) code 7204.21.0000 is 17% of gross weight; 8112.22.0000 is 100% of gross weight.

⁴For HTS codes 7404.00.0045, 7404.00.0062, and 7404.00.0080 contained weight for import quantity is 65% of gross weight. For HTS codes 7404.00.3045, 7404.00.3055, 7404.00.3065, 7404.00.3090, 7404.00.6045, 7404.00.6055, 7404.00.6065, and 7404.00.6090 contained weight for import quantity is 72%.

⁵Includes lead content of waste and scrap obtained from lead-acid batteries HTS codes 7802.00.0030 and 7802.00.0060.

⁶Contained weight for import and export quantities is 0.4% of gross quantity for HTS code 7204.29.0000, 50% for HTS code 7503.00.0000, and 7.5% for HTS code 7204.21.0000.

⁷Includes tin waste and scrap HTS code 8002.00.0000.
