End Uses of Fluorspar

Fluorspar End-Use Worksheet Notes

Data Source

The source of data for the fluorspar end-use worksheet is the Minerals Yearbook, an annual collection, compilation, and analysis of mineral industry data, published by the U.S. Bureau of Mines and the U.S. Geological Survey.

End Use

End use is defined as the use of the mineral commodity in a particular industrial sector or product. For fluorspar, end-use categories are hydrofluoric acid, metallurgical, open-hearth furnace, basic oxygen furnace, electric arc furnace, and other industrial uses. The undistributed category equals the disparity between apparent consumption and fluorspar used by consumers and distributors. It accounts for trade adjustments and changes in stocks.

Aluminum fluoride is included with the hydrofluoric acid category from 1975–87, with the other category from 1988–94, and again with hydrofluoric acid from 1995–2003. The other category includes enamel and pottery, glass and fiberglass, iron and steel foundries, primary aluminum and magnesium, and welding rod coatings. Starting with 2000, the metallurgical category emerged owing to a change in data collection methodology; this category contains data previously reported by furnace type.

Blank cells in the spreadsheet indicate that data were not available. Data are rounded to no more than three significant digits; data may not add to totals shown.
