

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

May 2013

The primary metals leading index decreased a second month in a row in April, and its 6-month smoothed growth rate sank deeper in negative territory, suggesting that an upturn in U.S. metals industry activity might be farther away than earlier data indicated. The U.S. economic recovery has been supporting domestic primary metals industry activity with modest metals demand from the manufacturing sector; however, recent data now indicate that this sector is decreasing its metals consumption. However, the construction sector has performed strongly in the first quarter of 2013 and is generating moderate metals demand. Slower global economic growth continues to lower demand for U.S. metals and metal products. The metals price leading index has decreased since the start of the year, suggesting further metals price declines. Furthermore, metals inventories in the United States and other countries continue to build, restricting metals price growth.

The **primary metals leading index** decreased 1.9% to 157.5 in April, from a revised 160.6 in March. The index's 6-month smoothed growth rate, a compound annual rate that measures the near-term trend, sank to -3.0% from a revised 0.5% in March. A growth rate above +1.0% is usually a sign of an upward near-term trend for future metals activity, while a growth rate below -1.0% indicates a downward trend. For an explanation of these indexes and a definition of the primary metals industry, [see page 10](#).

All four of the index's available components decreased in April. A one-half-hour shorter average workweek in primary metals establishments contributed -1.1 percentage point to the overall decline in the leading index. The falling stock price index combining construction and farm machinery companies and industrial machinery companies contributed -0.5 percentage points to the leading index. The drop in the USGS metals price index growth rate contributed -0.2 percentage points. The Institute for Supply Management's PMI is hovering barely above the threshold that denotes an expansion in future U.S. manufacturing activity. It pulled the leading index down 0.2 percentage points as well. The primary metals leading index is subject to revision next month when the remaining four components become available.

The primary metals leading index growth rate settled solidly within the range that signals a downward trend for primary metals activity. Although new orders for durable goods increased sharply in April, most of that increase came from the volatile aircraft equipment industry. New orders for primary metals increased only marginally. The metals consumption from the manufacturing sector is likely to be limited in the months directly ahead. In the construction sector, particularly the housing industry, metals consumption will likely continue to rise,

offsetting the weaker metals consumption from the manufacturing sector. Updated economic outlooks from the IMF and the OECD indicate slower global economic growth, further highlighting the prospects for weaker demand for U.S. metals and metal products.

The **steel leading index** decreased 1.3% in March, the latest month for which it is available, to 110.5 from a revised 111.9 in February. Its 6-month smoothed growth rate declined to 0.3% from a revised 2.8%. The decreasing PMI made the largest contribution to the net decline in the steel leading index in March. The tumbling S&P stock price index for iron and steel companies and fewer new orders for iron and steel products also made sizable negative contributions. Retreats in shipments of household appliances and the index of new housing permits issued pulled the steel leading index down further in March. Although the steel leading index growth rate has been generally increasing since July, the sharp decline over the last 2 months suggests that an upturn in steel industry activity is not likely in the near term. Slower manufacturing growth in the United States and other countries could delay a recovery in the U.S. steel industry.

The **copper leading index** decreased 0.8% in March to 129.7 from 130.7 in February. Its 6-month smoothed growth decreased to 7.0% from a revised 9.4% in February. Most of the index's six indicators decreased, but it was the partial pullback from the nearly 3-hour longer average workweek in nonferrous metals (except aluminum) establishments in February that made the largest negative contribution to the copper leading index. The soaring S&P stock price index for building products companies made the only positive contribution. The high copper leading

index growth rate would normally indicate that activity in the U.S. copper industry could increase sharply; however, record high copper inventories are preventing robust activity growth.

Slower Global Economic Growth Suppresses Metals Price Increases

The **metals price leading index** decreased 0.4% to 107.8 in March, the latest month for which it is available, from a revised 108.2 in February. Its 6-month smoothed growth rate decreased to 1.1% from a revised 2.0% in February. Three of the leading index's indicators decreased. The declining growth rate of the trade-weighted average exchange value of other major currencies against the U.S. dollar contributed -0.6 percentage points to the net decline in the metals price leading index. The growth rate of the inflation-adjusted value of new orders for U.S. nonferrous metal products also decreased in March. It contributed -0.2 percentage points to the leading index. The contribution from a slightly closer yield spread between the U.S. 10-year Treasury note and the federal funds rate rounded to zero. In contrast, the

Organization for Economic Cooperation and Development (OECD) Total Leading Index growth rate continued its upward climb in March and contributed 0.3 percentage points. This is the seventh consecutive increase in this OECD indicator, showing modest growth in some industrialized countries. However, China is not included in this index. The metals price leading index signals major changes in the growth rate of nonferrous metal prices an average of 8 months in advance.

The growth rate of the inflation-adjusted value of U.S. nonferrous metal products inventories, which is an indicator of supply and usually moves inversely with the price of metals, decreased in March. However, these inventory levels continued to rise and reached a new recent high. Slower global economic growth and rising metals inventories are suppressing metal prices. A draw-down of inventories is needed for metals price growth to resume.

The business cycle and inventories are only two factors in metal price determination. Some other factors that affect prices include changes in metals production, strategic stockpiling, foreign exchange rates, speculation, and production costs.

Table 1.
Leading Index of Metal Prices and Growth Rates of the Nonferrous Metals Price Index, Inventories of Nonferrous Metal Products, and Selected Metal Prices

| | Six-Month Smoothed Growth Rates | | | | | |
|-------------|--|-----------------------------------|---|------------------|----------------|-------------|
| | Leading Index of Metal Prices (1967=100) | MII Nonferrous Metals Price Index | U.S. Nonferrous Metal Products Inventories (1982\$) | Primary Aluminum | Primary Copper | Steel Scrap |
| 2012 | | | | | | |
| March | 107.0 | -5.3 | 9.8 | -20.0 | -2.7 | -3.0 |
| April | 107.3 | -1.6 | 11.9 | -20.3 | 0.0 | -6.4 |
| May | 106.4 | -20.3 | 16.1 | -22.5 | -19.6 | -3.6 |
| June | 105.6 | -17.0 | 18.5 | -29.1 | -15.3 | -25.1 |
| July | 105.8 | -13.6 | 20.8 | -23.5 | -13.0 | -38.6 |
| August | 106.3 | 9.9 | 20.1 | -20.5 | -9.5 | -13.5 |
| September | 107.2 | 11.0 | 12.3 | 4.2 | 9.7 | -17.9 |
| October | 107.1 | -2.8 | 9.7 | -13.7 | -3.2 | -34.0 |
| November | 107.4r | 1.8 | 12.6r | 6.1 | 0.0 | -11.2 |

| January | 108.5 | 6.0 | 11.8 | 4.2 | 3.3 | -6.8 |
| February | 108.2r | -2.1 | 11.5r | -4.7 | -4.0 | -9.4 |
| March | 107.8 | -7.7 | 9.7 | -9.3 | -8.1 | 7.0 |
| April | NA | -16.8 | NA | -10.9 | -17.7 | -1.4 |

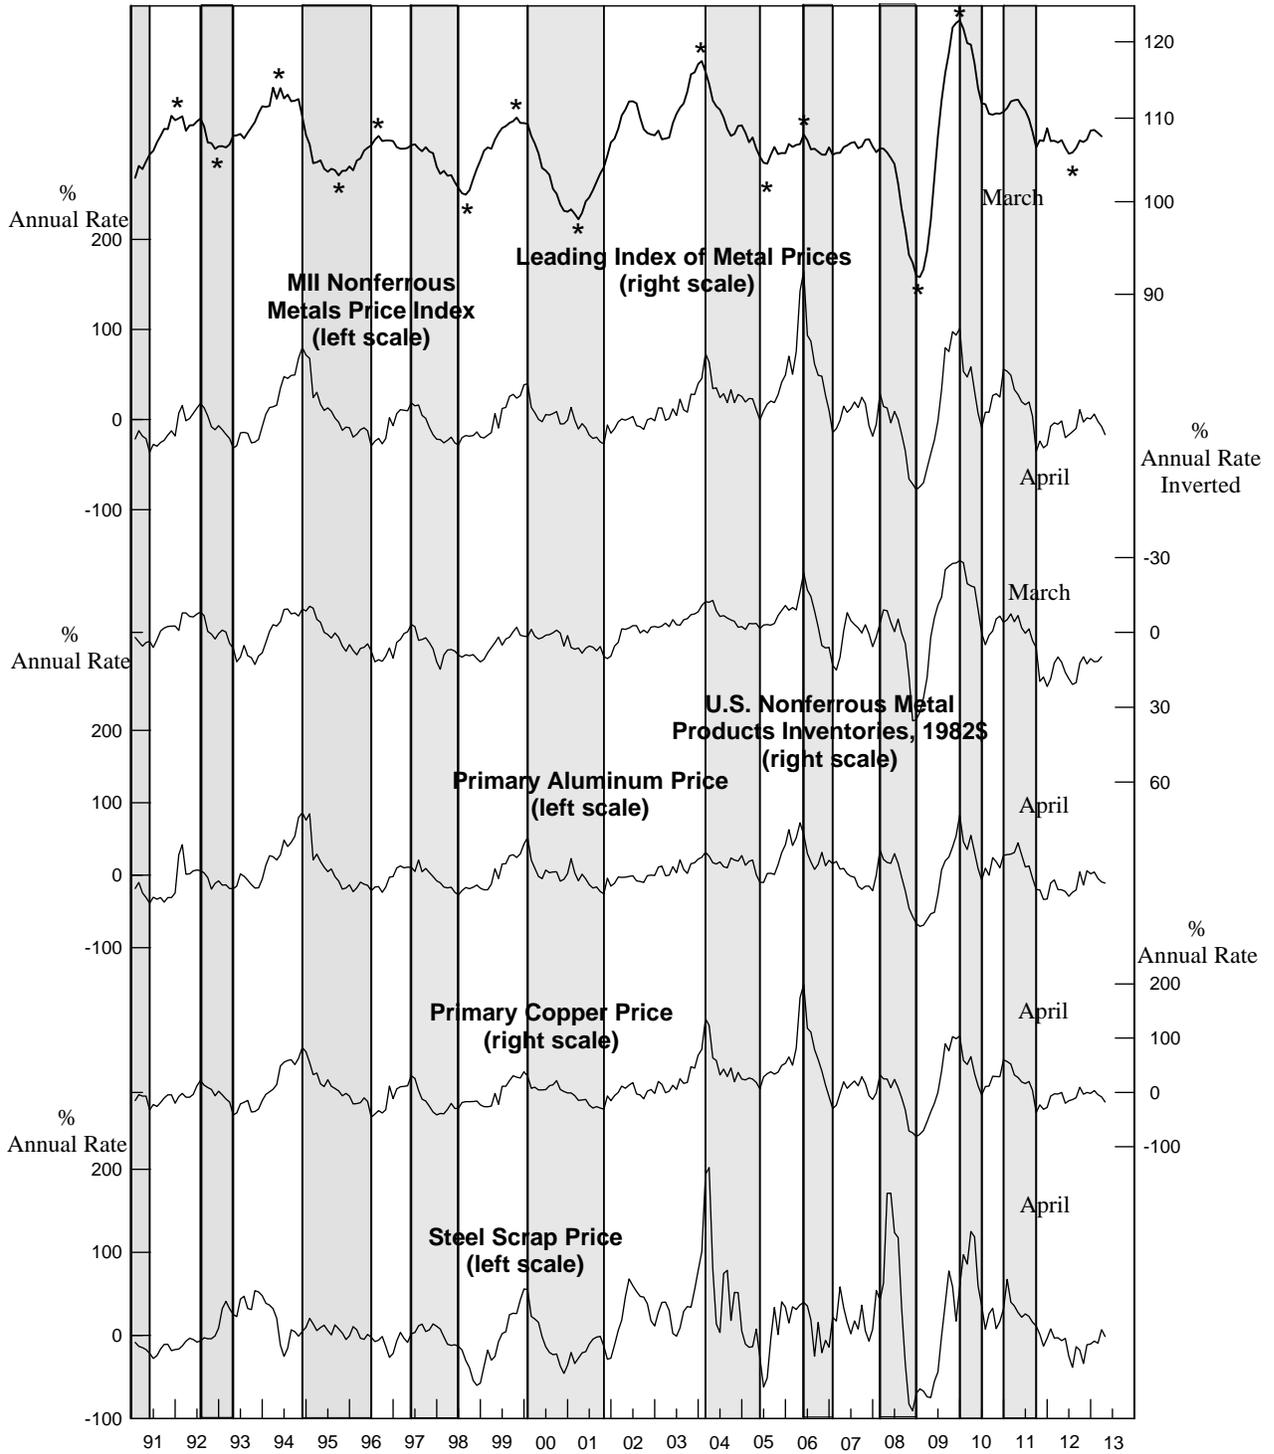

NA: Not available r: Revised

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Organization for Economic Cooperation and Development (OECD) Total Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 6.
COPPER: LEADING AND COINCIDENT INDEXES, 1991-2013

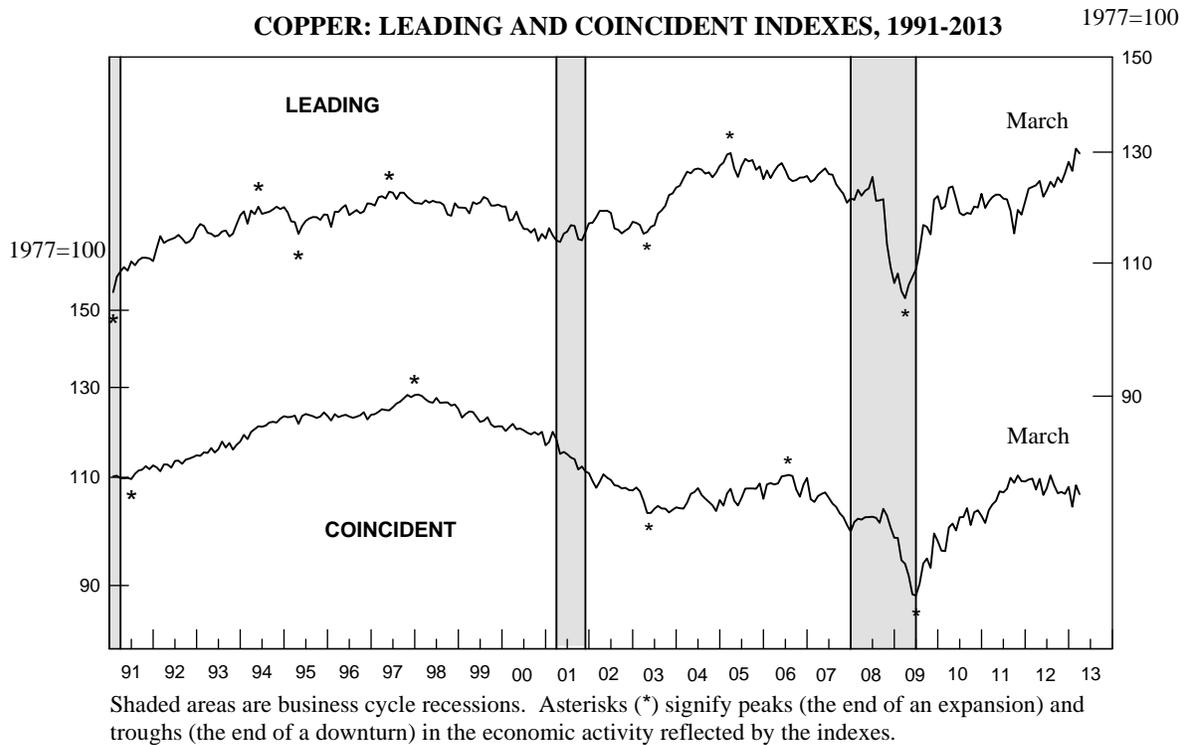

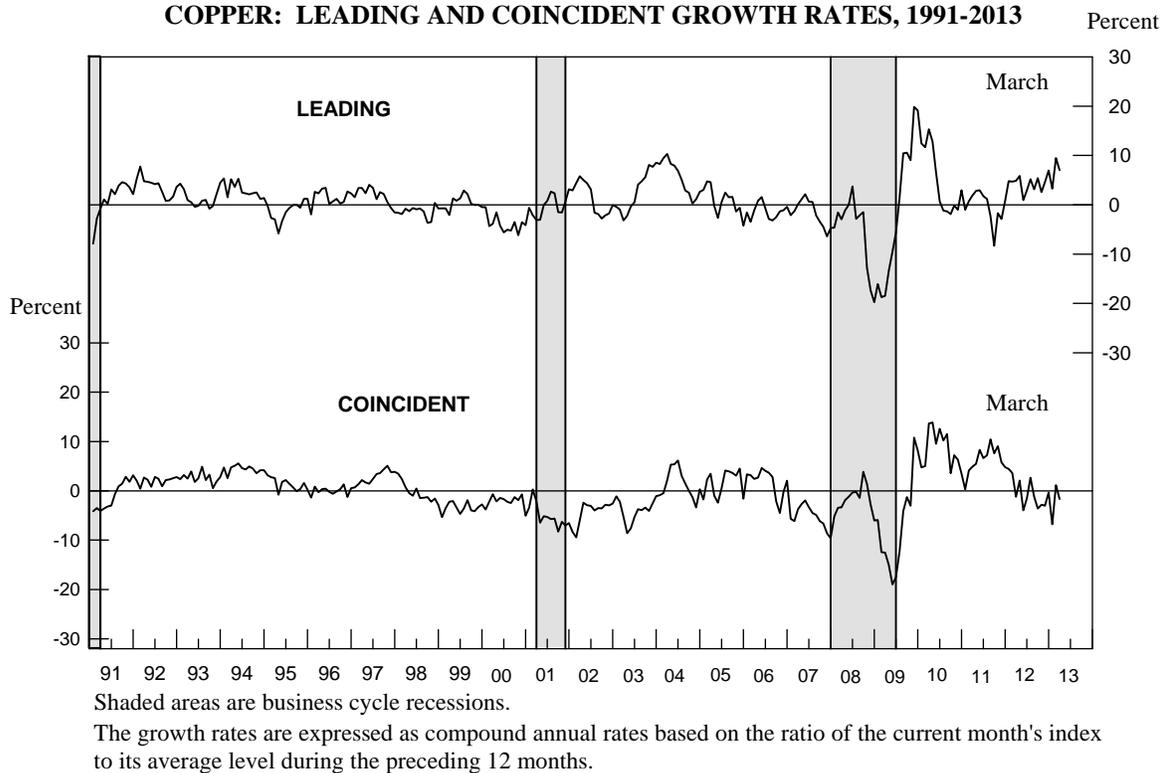

CHART 7.
COPPER: LEADING AND COINCIDENT GROWTH RATES, 1991-2013

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹Business Cycle Indicators, A monthly report from The Conference Board (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next update for these indexes is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, June 21. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the National Minerals Information Center. The report is prepared by Gail James (703-648-4915; e-mail: gjames@usgs.gov) and Ken Beckman (703-648-4916; e-mail: kbeckman@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
